## Abstract:

In this paper we introduce continuity of fuzzy maps

## 1. Introduction

**1.1** The concept of continuous function in case of metric spaces and topological spaces is an important study in Analysis and Topology. In the year 1965 L.A.Zadeh introduced the concept of fuzzy sets. In the year 2015, myself and others introduced fuzzy maps.

## 1.2 Preliminaries

**1.2.1** Let  $X$  and  $Y$  be two non empty sets. A function  $F: X \times Y \rightarrow [0,1]$  is called a fuzzy map from  $X$  to  $Y$ .

**1.2.2** Let  $F$  be a fuzzy map from  $X$  to  $Y$ . Let  $x_0 \in X$ . Then  $F(x_0) = \{ y \in Y / F(x_0, y)=1 \}$ .  $F(x_0)$  is called the image of  $x_0$

**1.2.3** Let  $F$  be a fuzzy map from  $X$  to  $Y$ . Let  $A$  be a non empty subset of  $X$ .  $F(A) = \{ y \in Y / F(x, y)=1 \text{ for some } x \in A \}$

**1.2.4** Let  $F$  be a fuzzy map from  $X$  to  $Y$ . Let  $y_0 \in Y$ .  $F^{-1}(y_0) = \{ x \in X / F(x, y_0)=1 \}$ .

**1.2.5** Let  $F$  be a Fuzzy map from  $X$  to  $Y$ . Let  $B \subset Y$ .  $F^{-1}(y_0) = \{ x \in X / F(x, y)=1 \text{ and } y \in B \}$

## 2. Continuity

**2.1 Definition** Let  $X$  and  $Y$  be metric spaces. Let  $F$  be a fuzzy map from  $X$  to  $Y$ . Let  $a \in X$ .  $F$  is continuous at  $x$  if for every  $\varepsilon > 0$ , for every  $b \in F(a)$ ,  $\exists \delta > 0$  such that  $x \in B(a, \delta)$  implies atleast one of the elements of  $F(x)$  belongs to  $B(a, \delta)$ .

**2.2 Example** Take  $X=Y=\mathbb{R}$

Define  $F: X \times Y \rightarrow [0,1]$  as

$$F(x, y) = \begin{cases} 1 & \text{if } y = 2x \text{ or } 3x \\ 0 & \text{otherwise} \end{cases}$$

take  $1 \in X$ .  $F(1) = \{2, 3\}$ . Consider  $2 \in F(1)$ . Let  $\varepsilon > 0$  be given. Take  $\delta = \varepsilon/2$ .  $x \in B(1, \delta)$ .  $F(x) = \{2x, 3x\}$ .  $|x-1| < \delta$

$$\Rightarrow 2|x-1| < 2\delta \Rightarrow |2x-2| < 2\delta \Rightarrow |2x-2| < \varepsilon$$

$\Rightarrow$  one value of  $F(x) \in B(2, \delta)$ . Now consider  $3 \in F(1)$ .

Take  $\delta = \varepsilon/3$ .  $|x-1| < \delta \Rightarrow 3|x-1| < 3\delta \Rightarrow |3x-3| < 2\delta \Rightarrow |3x-3| < \varepsilon \Rightarrow$  one value of  $F(x) \in B(3, \delta)$ . Hence  $F$  is continuous at  $x=1$ .

**2.3 Definition** Let  $X$  and  $Y$  be metric spaces. Let  $F$  be a fuzzy map from  $X$  to  $Y$ .  $F$  is continuous if  $F$  is continuous at each point of  $X$ .

**2.4 Example** Take  $X=Y=\mathbb{R}$ .

$$F(x, y) = \begin{cases} 1 & \text{if } y = 5x \\ 0.5 & \text{if } y = x^3 \\ 0 & \text{otherwise} \end{cases}$$

Take  $a \in X$ ,  $F(a) = \{5a\}$ . Consider  $5a$  for  $x \in X$ ,  
 $F(x) = \{5x\}$ . Let  $\varepsilon > 0$  be given. Take  $\delta = \varepsilon/5$ .  $x \in B(a, \delta)$   
 $\Rightarrow |x-a| < \delta \Rightarrow |5x-5a| < 5\delta \Rightarrow |5x-5a| < \varepsilon \Rightarrow 5x \in B(5a, \varepsilon) \Rightarrow$   
 one value of  $F(x) \in B(5a, \varepsilon)$ .  $F$  is continuous at  $a \in X$ .  
 This is true for all  $a \in X$ . Hence  $F$  is Continuous.

**2.4 Theorem** Let  $X$  and  $Y$  be two metric spaces.

Let  $f: X \rightarrow Y$  be a crisp map. Let  $F$  be the  
 Corresponding fuzzy map. Let  $a \in X$ .  $f$  is continuous  
 at  $a$  implies  $F$  is continuous at  $a$ .

**Proof :**  $X$  and  $Y$  are metric spaces.  $a \in X$ .  $f: X \rightarrow Y$  is  
 a crisp map. The corresponding fuzzy map is defined  
 as follows

$$F(x, y) = \begin{cases} 1 & \text{if } y = f(x) \\ 0 & \text{otherwise} \end{cases}$$

Now  $f$  is continuous at  $a$ .

Claim  $F$  is continuous at  $a$ . Now  $F(a) = \{f(a)\}$ . Let  $\varepsilon > 0$   
 be given. Since  $f$  is continuous at  $a$ ,  $\exists \delta > 0$  such that  $x$   
 $\in B(a, \delta) \Rightarrow f(x) \in B(f(a), \varepsilon)$ . Clearly  $F(x) = \{f(x)\}$ .

Therefore one value of  $F(x) \in B(f(a), \varepsilon)$ . Hence  $F$  is  
 Continuous at  $a$ .

**2.5 Theorem** Let  $X$  and  $Y$  be two metric spaces.

Let  $f: X \rightarrow Y$  be a crisp map. Let  $F$  be the  
 corresponding fuzzy map. Let  $a \in X$ .  $F$  is continuous  
 at  $a$  implies  $f$  is continuous at  $a$ .

**Proof:**  $F$  is defined as in theorem 2.4.  $F(a) = \{f(a)\}$ .

Let  $\varepsilon > 0$  be given.  $F$  is continuous at  $a$ . Hence  $\exists \delta > 0$   
 such that  $x \in B(a, \delta) \Rightarrow$  one value of  $F(x) \in B(f(a), \varepsilon)$ .

Clearly  $F(x) = \{f(x)\}$ . Hence  $f(x) \in B(f(a), \varepsilon)$ . Hence  $f$   
 is continuous at  $a$ .

**2.6 Theorem** Let  $X$  and  $Y$  be two metric spaces.

Let  $f: X \rightarrow Y$  be a crisp map. Let  $F$  be the  
 Corresponding fuzzy map.  $f$  is continuous at  $a$  if  
 and only if  $F$  is continuous at  $a$ .

**Proof :** Follows from above theorems.

**2.7 Theorem** Let  $X$  and  $Y$  be two metric spaces.

Let  $f: X \rightarrow Y$  be a crisp map. Let  $F$  be the  
 Corresponding fuzzy map.  $f$  is continuous if and  
 only if  $F$  is continuous.
