INTRODUCTION:
Online user behavior observations studies how and why users of e-commerce 1 flat structures and net structure applications do. It has been widely sent in name for in do, especially in commercial conditions, political campaigns, and net structure application 2 development. Data aggregation is one of the most full of danger operations in behavior observations. In our time, the aggregation tasks for user facts are outsourced to third-party facts aggregators including Google analytics com score quant cast and stat counter. While this going after design takes great benefits to observers and aggregators, it also raises serious business houses about Disclosure of users right not to be public. Aggregators place in ship for goods detailed knowledge for computers of users on-line behaviors, from which work to do with the structure of persons living in a place can be easily worked out. To keep safe (out of danger) users right not to be public, government and industry rules were put up, e.g. the European Union cookie Law and w3c.

EXISTING SOLUTION
In Existing System we focus on privacy-preserving mining on vertically partitioned databases. In such a scenario, data owners wish to learn the association rules or frequent item sets from a collective dataset, and disclose as little information about their (sensitive) raw data as possible to other data owners and third parties. To ensure data privacy, we design an efficient homomorphic encryption scheme and a secure comparison scheme.
- Cannot be built based on the frequent item set mining solution.
- Customer Privacy.
- We do not further assume the cloud has background knowledge of item set frequency.

OUR WORK:
In our proposed work, a cloud-aided privacy-preserving frequent item set mining solution for vertically partitioned databases, which is then used to build a privacy-preserving association rule mining solution. Both solutions are designed for applications where data owners have a high level of privacy requirement. The solutions are also suitable for data owners looking to outsource data storage.
- Our solution is significantly more efficient due to our customized HOMOMORPHIC ENCRYPTION scheme.
- Data owners to outsource mining task on their joint data in a privacy-preserving manner.

ABSTRACT: Every day on-line user behavior facts are being produced on the net, growing efforts have been loving to mining the more than enough behavior facts to get out of great value knowledge for make observations purposes or business interest. Online users still have the danger to make open to for third-parties. The last ten years are attempting to act data aggregation in a privacy-preserving way. Having existence methods have a strong right not to be public system of care for trade at the price of limited aggregation operations, such as summation process, which free from doubt the need of behavior observations. In this paper, we offer a most important schema 1 PPSSA, which encrypts users sensitive knowledge for computers to put a stop to right not to be public from both outside observers and the aggregation arm giver, and fully supports having selection mass purposes, uses for on-line user. We have instrumented new careful way and value the operation using a trace-driven evaluation. This careful way is based on a true on-line behavior knowledge. Our design effectively supports both over-all mass questions and having selection mass questions with working well pleasing computation 2 and news overheads.
MICROSOFT VISUAL STUDIO 2010:  
On April 12, 2010, Microsoft given out seeing work-room 2010 (WPF), whereas the insides have been designed again using managed Extensibility Framework (MEF) that offers more extensibility points than earlier accounts of the IDE that gave power to add-ins to make different the behavior of the IDE. The seeing work-room 2010 code 2 person in control of paper now high-lights have relation NET Framework4.0 Visual work-room 2010 IDE has been designed which, according to Microsoft, clears the UI organization and “gets changed to other form things about and being complex. The new IDE better up transports number times another Document 3 Windows and floating apparatus for making or put right things Windows, while offering better multi-monitor support. The IDE hard outer covering has been written again using the Foundationless; whenever a special sign is selected; all other use of the special sign are high-lighted. It also offers a Quick look for point to incrementally look for across all special signs in C++, C# and vb.net undertakings. Quick looking-for supports substring matches and camel Case searches. The name organizations with a scale of position points lets the one that makes to see all the methods that are called from a current careful way as well as the methods that telephonc the current one. intellisense in seeing work-room supports a consume-first most frequent number which ones that makes can make selection into. In this most frequent number, intellisense will not auto-complete things taken to be the same; this lets the one that makes to use unclear things taken to be the same (like not fixed in level or careful way names) and make statement of the sense of words those later. seeing work-room 2010 can also help in this by automatically making clear them, if it can use reasoning their types from use. Current accounts of seeing work-room have an experienced apparatus for secret hearing which makes intellisense unusable for projects using clear C 5 (not C++). Visual work-room last 2010 (formerly group System or group rooms) is codenamed Rosario. It includes new designing to be copied apparatus for making or put right things, such as the buildings and structure design one making discovery in new country.

STRUCTURED QUERY LANGUAGE (SQL):  
To work with facts in a knowledge-base, you must use a put of has authority over and statements (language) formed by the DBMS software 6. There are several different languages that can be used with of relation knowledge-bases; the most common is SQL. Both the American National quality examples Institute (ANSI ) and the International quality examples Organization ISO have formed standards for SQL. Most of-the-day DBMS products support the Entry 9 Level of SQL-92, the latest SQL quality example (made public in 1992).

MODULE
1. Data Allocation Module
2. Fake Object Module
3. Optimization module
4. Data Distributor

1.Data Allocation Module

data a thing or amount put to one side part of a greater unit The main chief place of our undertaking is the facts a thing or amount put to one side hard question as how can the one making distribution with by quick, ready brain give knowledge for computers to agents in order to get well the chances of sensing a responsible agent.

2.Fake Object Module

Fake purpose part of a greater unit false things are things produced by the one making distribution in order to increase the chances of sensing agents that place where liquid comes through facts. The one making distribution may be able to join false things to the made distribution facts in order to get well his good effects in sensing responsible representatives. Our use of false things is given impulse to by the use of a bit records in sending post lists.

3.Optimization Module

The making the most out of a part of a greater unit is the persons making distribution facts a thing or amount put to one side to agents has one force to limit and one end. The persons making distribution force to limit is to free from doubt agents requests, by making ready them with the number of things they request or with all ready (to be used) ends that give what is desired, needed to their conditions. His end is to be able to discover a person acting for who lets loose any part of his data.

4.Data Distributor

A facts one making distribution has given sensitive knowledge for computers to a group of as a probable law agents (third groups of persons). Some of the facts is leaked and found in a not with authority place (e.g. on the net structure or somebody small computer). The one making distribution must put a value on the chance that the leaked knowledge for computers came from one or more representatives, as opposite to having been not independently gathered by other means.

CONCLUSION

In this paper, we have offered a way in that takes to be the same which part of coming in between facts puts needs to be encrypted while the rest does not, in order to but for the right not to be public keeping safe price. A tree structure has been designed to be copied from the living-stage relationships of coming in between knowledge for computers puts to get at the details of right not to be public propagation 1 among knowledge for computers puts. We have designed to be copied the hard question of amount made less privacy-preserving price as a limited making the most out of hard question which is made house numbers by decomposing the right not to be public loss forces to limit. A useful rules through discovery by experience algorithm 2 has been designed as in agreement. put value results on real-world facts puts and larger much facts puts have put examples on view of the price of keeping safe right not to be public in cloud can be made lower, less importantly with our way in over having existence ones where all facts puts are encrypted. In agreement with different facts and computation 3 getting much out applications on cloud, coming in between facts put business managers is becoming an important make observations part. Right not to be public keeping safe for coming in between facts puts is one of important yet hard make observations question under discussion, and needs getting much out observations. With the contributions of this paper, we are idea to further make observation of right not to be public having knowledge of good at producing an effect of listing details of coming in between knowledge for computers set in cloud by taking right not to be public keeping safe as a metric together with other measure such as place for storing and computation. Optimized balanced listing details designs are looked on as to come to be undergone growth toward over-all highly good at producing an effect of right not to be public having knowledge of knowledge for computers put putting on time table
