Department of Management, Rajagiri Dawood Batcha College of Arts & Science, Papanasam – 614205, Tamilnadu.

Abstract: The purpose of this study was to examine nurses’ perception of the relationship between job satisfaction and quality of care they deliver, and barriers to a quality care. Data for this cross-sectional study was collected using a paper survey developed by the researcher. This 28-item questionnaire assessed nurses’ perception of the relationship between job satisfaction and the quality of care they deliver, and factors that affect the delivery of a quality care and job satisfaction. The questionnaire was distributed to 47 nurses who work in direct patient care at a small Minnesota hospital. Analysis included descriptive and correlation. The research found that there is a positive correlation between nurses’ job satisfaction and quality of care they deliver. The study also found that work-load, staff scheduling and stress to be the most significant factors that affect the delivery of a quality care. Moreover, pay/compensation, work environment and care quality are found to be the factors that affect nurses’ job satisfaction most.

Key words: Employee perception, Quality care, Stress management, Work environment

1. INTRODUCTION
The focal inquiry investigated in this writing audit is whether there is a connection between view of the nursing care quality and contrasts in nurse staffing, nurse work fulfillment, nurse practice condition, and burnout. Three essential thoughts support this inquiry: first, the developing spotlight on quality enhancement in social insurance; second, the worries being communicated about the nursing care quality; and, third, the driving force towards patient and open association and discussion in human services.

2. REVIEW OF LITERATURE

Although thereasons for leaving the hospital (Gardulf et al. 2005), or even the nursing profession, are complex, both individual and work-related factors seem to be associated with the high turnover rates in nursing (Collins et al. 2000, Gardulf et al. 2005, Flinkman et al. 2008).

(Cho 2001, Cimiotti 2007, Hugonnet et al. 2007) Patient adverse outcomes consist of infections patient falls (Dunton et al. 2004), increased length of stay (Lang et al. 2004) and mortality (Lang et al. 2004, Kane et al. 2007). These patient adverse outcomes are associated with nursing workload and are related to a higher hospital cost (Apostolopoulou & Veldekis 2004). To address this problem, it is essential to get a better insight into the non-direct patient care factors that determine nursing workload.

(Tewes, 2009) Effects of changes to the healthcare system on care delivery. By 1980, Medicare claims expenditures had risen dramatically and resulted in a major change in reimbursement policy. Reimbursement of Medicare claims through the use of “usual, customary, and reasonable rates” was replaced by a set of fee schedules based on diagnosis (diagnosis related groups or DRGs) and is the system in use today. Healthcare facilities have faced increasing challenges from changes in payment schedule and regulatory requirements from the federal government and private insurance companies. As employers, they had to share the medical cost of their employees.

(Peltier & Dahl, 2009) This means health facilities had to implement strategies that could ensure their financial wellbeing. Restructuring, cutting costs, and cutting employee benefits are the most common actions taken by employers. Moreover, the management of healthcare personnel takes place in a complex environment involving a variety of professionals, extensive use of materials and equipment, and an array of services that extend beyond health care to include food, hospitality and instruction.
One of the common actions taken to cut cost is reducing the size of the workforce. Because nurses are the largest professional group in the healthcare organization and critical to the provision of healthcare, reducing the nursing workforce was considered as the first strategy to decrease expenses in most hospitals. 

Saari and Judge (2004) defined job satisfaction as “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences”.

Chang and colleagues (2009) because nursing remains in the midst of its most significant shortage, the satisfaction or dissatisfaction of nurses is of great concern to nursing and hospital administrators (Lynn, Moore, & Morgan, 2009). In a survey of Chinese nurses, found job satisfaction was a significant predictor of whether or not a nurse intended to leave a current job.

(Mrayyan, 2006) Dissatisfied nurses may be distracted from their patients, fail to provide holistic care, and in general, provide a lower quality of nursing care. According to Kvist, Voutilainen, Mantynen, and Vehvilainen-Julkunen (2014), job satisfaction of nursing staff is related to patients’ perceptions of quality of care.

3. STATEMENT OF THE PROBLEM

The purpose of this study was to examine nurses’ perception of the relationship between job satisfaction and quality of care nurses deliver, and barriers to a quality care. Understanding the importance of employee satisfaction, and understanding how employees’ satisfaction can be enhanced is essential to providing quality healthcare service with desirable outcomes.

4. METHODS

A descriptive qualitative research design was used to collect data. Four focus groups were conducted, one each with 6 or 7 registered nurses in health care, hospital care, home care and nursing home care. A total of 47 nurses were recruited through purposeful sampling. The interviews were audio taped, transcribed and subjected to thematic analysis.

Data Collection/Instrumentation

The survey used in this study addressed two purposes. The first purpose was to examine the relationship between nurses’ job satisfaction and quality of care they deliver. The second purpose was to explore factors that affect nurses’ job satisfaction.

Sample Size, Composition And Data Collection

To gain a deeper understanding of the influence of the nursing work environment on patient experiences, we conducted four focus groups. The purpose was to elicit ideas, thoughts and perceptions from nurses.

5. NEED FOR STUDY

Patients should be provided with safe and high quality healthcare service. As a result, healthcare organizations have the responsibility to provide effective service targeting a desirable outcome. Healthcare employees have moral and professional responsibilities to promote the values and missions of their employers. This study investigated the relationship between nurses’ job satisfaction and quality of healthcare they deliver, and ways to satisfy employees and improve the quality of care. Understanding the importance of employees’ job satisfaction, and understanding how employees’ job satisfaction can be enhanced is essential to provide quality healthcare service with desirable patient outcomes. The dependent variable was the nurses’ perception of quality of care delivered and the independent variable was employees’ job satisfaction.

6. DATA ANALYSIS

The transcribed data were open coded and categorized. Several themes were extracted by organising and structuring the categories. During the analytical process, interview fragments were constantly compared. The literally transcribed interviews were reviewed several times to check whether elements might have been overlooked. The final analysis was presented to the participants and they were asked to comment on the contents. This member check helped to determine whether we had adequately understood and interpreted the data.

MANN-WHITNEY U - TEST

| Table - 1 |
| Statistical test results using Mann-Whitney u-test |

| Mann-Whitney U TEST | 35.000 |
| Wilcoxon W | 288.00 |
| Z | -4.878 |
| Significance at 2-tailed test | 0.000 |
| a. grouping variable :funding |

Statistical test results using the Mann-Whitney test which is used to measure difference in the quality of services based on the financing. Based on above table, it can be seen that significance at 2-tailed test has a value of 0.00, so it can be concluded that H0 is rejected and accept Ha that there are difference in outpatient satisfaction between patients in primary health care.
FACTORS THAT AFFECT QUALITY OF CARE

Pay compensation (62.5%), work environment (56.3%) and quality of care (43.8%) were among the top three factors mostly mentioned by participants as affecting job satisfaction. Above the table shows participants’ rating of factors that influence job satisfaction. Pay, work environment, quality of care and stress were among the top three factors participant selected.

7. LIMITATIONS OF THE STUDY

There were few limitations to the study. Lack of demographic information of participants was a limitation to the study. The study had to exclude gender from demographic questions for the purpose of participant anonymity since some units might have a single male employee. This limitation limited the researcher comparing job satisfaction between different genders.

8. FINDINGS

- Statistical test results using the Mann-Whitney test which is used to measure difference in the quality of services based on the financing. Based on above table it can be seen that significance at 2-tailed test has a value of 0.00, so it can be concluded that H0 is rejected and accept Ha that there are difference in outpatient satisfaction between patients in primary health care.
- Participants pick of the three top most factors that affect the delivery of quality care. Work load was mentioned by 87.5% of participants, staff scheduling was mentioned by 81.3% and stress was the third most mentioned factor (68.8%).
- Lack of demographic information of participants was a limitation to the study. The study had to exclude gender from demographic questions for the purpose of participant anonymity since some units might have a single male employee. This limitation limited the researcher comparing job satisfaction between different genders.

9. RECOMMENDATION

Further research is recommended to examine whether the elements of a healthy work environment are statistically related to patient experiences in the Dutch healthcare setting. In the Netherlands, patient experiences are measured with the Consumer Quality Index.

10. CONCLUSION

In investigating the connection between nurse staffing, nurse work fulfillment, nurse practice condition, burnout, and nursing care quality have been related factors. This audit asserts the significance of nurses’ view of consideration quality as a result variable to survey work ecological components. The discoveries of this audit are imperative for nurse scientists to investigate manners by which we may start to be progressively imaginative in guaranteeing that patients’ points of view on nursing care quality are given equivalent load to the clinical nurses’ voice in any appraisal of value in future nursing thinks about.
