## ABSTRACT

In this paper we introduce a new class of sets called  $\tau_1\tau_2\#$ regular generalized closed (briefly,  $\tau_1\tau_2\#$ rg-closed) sets in bitopological space. We prove that this class lies between closed sets and  $\tau_1\tau_2$  rg-closed sets. We discuss some basic properties of  $\tau_1\tau_2\#$ regular generalized closed sets. Applying this we introduce a new space called  $T\tau_1\tau_2\#$ rg space.

**Keywords:**  $\tau_1\tau_2$ rw-open sets,  $\tau_1\tau_2\#$ rg-closed sets,  $T\tau_1\tau_2\#$ rg-space.

## INTRODUCTION:

A triple  $(X, \tau_1, \tau_2)$ , where  $X$  is a non empty set and  $\tau_1$  and  $\tau_2$  are topologies on  $X$  is called a bitopological space. In 1963, Kelly initiated the study of bitopological spaces. In 1985, Fukutake introduce the concept of g-closed sets in bitopological spaces and after that several authors turned their attention towards generalizations of various concepts of topology by considering bitopological spaces. The aim of this paper is to extend the same concept in bitopological spaces. We introduce a new class of sets called  $\tau_1\tau_2\#$ regular generalized closed sets which is properly placed in between the class of closed sets and the class of  $\tau_1\tau_2$ rg-closed sets.

Throughout this paper  $(X, \tau_1, \tau_2)$  represents a bitopological space on which no separation axiom is assumed unless otherwise mentioned. For a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$ ,  $\tau_2\text{cl}(A)$  and  $\tau_1\text{int}(A)$  denote the  $\tau_2$ closure of  $A$  and the  $\tau_1$ interior of  $A$  respectively.  $X \setminus A$  denotes the complement of  $A$  in  $X$ . We recall the following definitions and results.

**Definition: 1.1** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called

- (1)  $\tau_1\tau_2$  preopen set [9] if  $A \subseteq \tau_1\text{int}\tau_2\text{cl}(A)$  and a  $\tau_1\tau_2$  preclosed set if  $\tau_2\text{cl}\tau_1\text{int}(A) \subseteq A$ .
- (2)  $\tau_1\tau_2$  semiopen set [1] if  $A \subseteq \tau_2\text{cl}\tau_1\text{int}(A)$  and a  $\tau_1\tau_2$  semiclosed set if  $\tau_1\text{int}\tau_2\text{cl}(A) \subseteq A$ .
- (3)  $\tau_1\tau_2$  regular open set [14] if  $A = \tau_1\text{int}\tau_2\text{cl}(A)$  and a  $\tau_2$  regular closed set if  $A = \tau_2\text{cl}\tau_1\text{int}(A)$ .
- (4)  $\tau_1\tau_2\pi$ -open set [25] if  $A$  is a finite union of regular open sets.
- (5)  $\tau_1\tau_2$  regular semi open if there is a  $\tau_1$  regular open  $U$  such  $U \subseteq A \subseteq \tau_2\text{cl}(U)$ .

**Definition: 1.2** A subset  $A$  of  $(X, \tau_1, \tau_2)$  is called

- (1)  $\tau_1\tau_2$  generalized closed set (briefly,  $\tau_1\tau_2$ g-closed) [5] if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- (2)  $\tau_1\tau_2$  regular generalized closed set (briefly,  $\tau_1\tau_2$ rg-closed) [7] if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$ -regular open in  $X$ .
- (3)  $\tau_1\tau_2$  generalized preregular closed set (briefly,  $\tau_1\tau_2$ gpr-closed) if  $\tau_2\text{pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$ -regular open in  $X$ .
- (4)  $\tau_1\tau_2$  weakly generalized closed set (briefly,  $\tau_1\tau_2$ wg-closed) if  $\tau_2\text{cl}\tau_1\text{int}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$ -open in  $X$ .
- (5)  $\tau_1\tau_2\pi$ -generalized closed set (briefly,  $\tau_1\tau_2\pi$ g-closed) if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1\pi$ -open in  $X$ .
- (6)  $\tau_1\tau_2$  weakly closed set (briefly,  $\tau_1\tau_2$ w-closed) if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$  semi open in  $X$ .
- (7)  $\tau_1\tau_2$  regular weakly generalized closed set (briefly,  $\tau_1\tau_2$ rwg-closed) if  $\tau_2\text{cl}\tau_1\text{int}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$  regular open in  $X$ .
- (8)  $\tau_1\tau_2$  rw-closed if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$  regular semi open.
- (9)  $\tau_1\tau_2$ \*g-closed if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1$ w-open.

The complements of the above mentioned closed sets are their respective open sets.

**Definition: 1.3** A space  $(X, \tau_1, \tau_2)$  is called  $T_{1/2}$ -space [9] if every  $g$ -closed set is closed.

## 2. $\tau_1\tau_2$ #REGULAR GENERALIZED CLOSED SETS AND THEIR BASIC PROPERTIES

We introduce the following definition

**Definition: 2.1** A subset  $A$  of a space  $X$  is called  $\tau_1\tau_2$ #regular generalized closed (briefly  $\tau_1\tau_2$ #rg-closed) set if  $\tau_2\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_1\tau_2$  rw-open. We denote the set of all  $\tau_1\tau_2$ #rg-closed sets in  $X$  by  $\tau_1\tau_2$ #RGC( $X$ ).

First we prove that the class of  $\tau_1\tau_2$ #regular generalized closed sets properly lies between the class of closed sets and the class of  $\tau_1\tau_2$ rg-closed sets.

**Example: 2.2** Let  $X = \{a, b, c\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{a, c\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$  then  $\tau_1\tau_2$ #rg-closed sets are  $\{\emptyset, X, \{a\}, \{b\}, \{b, c\}\}$ .

**Theorem: 2.3** Every closed sets are  $\tau_1\tau_2$ #rg-closed sets, but not conversely.

**Proof:** The proof follows from the definition.

The converse of the above theorem need not be true as seen from the following example.

**Example: 2.4** Let  $X = \{a, b, c\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$   $\tau_2$  closed sets are  $\{\emptyset, X, \{a\}, \{b, c\}\}$  and  $\tau_1\tau_2$ #rg-closed sets are  $\{\emptyset, X, \{a\}, \{a, c\}, \{b, c\}\}$  then  $\{a, c\}$  is  $\tau_1\tau_2$ #rg-closed sets but it is not  $\tau_2$  closed sets.

**Theorem: 2.5.** Every  $\tau_1\tau_2$ #rg-closed sets are  $\tau_1\tau_2$ rg-closed but not conversely.

**Proof:** Let  $A$  be a  $\tau_1\tau_2$ #rg-closed. Let  $A \subseteq U$  and  $U$  is regular open. Since  $U$  is regular open,  $U$  is rw-open. Now  $A \subseteq U$  and  $A$  is  $\tau_1\tau_2$ #rg-closed then  $\tau_2\text{cl}(A) \subseteq U$ . Therefore  $A$  is  $\tau_1\tau_2$ rg-closed.

The converse of the above theorem need not be true as seen from the following example.

**Example: 2.6** Let  $X = \{a, b, c\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$  then  $\{a, b\}$  is  $\tau_1\tau_2$ rg-closed sets but not  $\tau_1\tau_2$ #rg-closed sets.

**Theorem: 2.7** Every  $\tau_1\tau_2$ #rg-closed sets are  $g$ -closed but not conversely.

**Proof:** Let  $A$  be a  $\tau_1\tau_2$ #rg-closed. Let  $A \subseteq U$  and  $U$  is open. Since  $U$  is open,  $U$  is  $\tau_1\tau_2$  rw-open. Now  $A \subseteq U$  and  $A$  is  $\tau_1\tau_2$ #rg-closed then  $\tau_2\text{cl}(A) \subseteq U$ . Therefore  $A$  is  $\tau_1\tau_2$ g-closed.

The converse of the above theorem need not be true as seen from the following example.

**Example: 2.8** Let  $X = \{a, b, c, d\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$ , then the set  $A = \{d\}$  is  $g$ -closed but not  $\tau_1\tau_2$ #rg-closed set in  $X$ .

**Theorem: 2.9** The union of two  $\tau_1\tau_2$ #rg-closed subsets of  $X$  is also  $\tau_1\tau_2$ #rg-closed subset of  $X$ .

**Proof:** Assume that  $A$  and  $B$  are  $\tau_1\tau_2$ #rg-closed set in  $X$ . Let  $U$  be  $\tau_1\tau_2$ rw-open in  $X$  such that  $A \cap B \subseteq U$ . Then  $A \subseteq U$  and  $B \subseteq U$ . Since  $A$  and  $B$  are  $\tau_1\tau_2$ #rg-closed,  $\tau_2\text{cl}(A) \subseteq U$  and  $\tau_2\text{cl}(B) \subseteq U$ . Hence  $\tau_2\text{cl}(A \cap B) = \tau_2(\text{cl}(A)) \cap \tau_2(\text{cl}(B)) \subseteq U$ . Thus  $\tau_2\text{cl}(A \cap B) \subseteq U$ . Therefore  $A \cap B$  is  $\tau_1\tau_2$ #rg-closed set in  $X$ .

**Remark: 2.10** The intersection of two  $\tau_1\tau_2$ #rg-closed sets in  $X$  is generally not  $\tau_1\tau_2$ #rg-closed set in  $X$ .

**Example: 2.11** Let  $X = \{a, b, c, d\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\}$ ,  $\tau_1\tau_2\#rg$ -closed sets are  $\{\emptyset, X, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{b, c, d\}, \{a, c, d\}\}$  then  $\{b, c\} \cap \{b, d\} = \{b\}$  but it is not  $\tau_1\tau_2\#rg$ -closed set.

**Theorem: 2.12** Let  $A$  be a  $\tau_1\tau_2\#rg$ -closed set in  $X$  then  $\tau_2cl(A) \setminus A$  does not contain any non empty  $\tau_1\tau_2rw$ -closed set.

**Proof:** Let  $F$  be a non empty  $\tau_1\tau_2rw$ -closed subset of  $\tau_2cl(A) \setminus A$ . Then  $A \subseteq X \setminus F$  where  $A$  is  $\tau_1\tau_2\#rg$ -closed and  $X \setminus F$  is  $rw$ -open. Then  $\tau_2cl(A) \subseteq X$ . For equivalently  $F \subseteq X \setminus \tau_2cl(A)$ . Since by assumption  $F \subseteq \tau_2cl(A)$ , we get a contradiction.

The converse of the above theorem need not be true seen from the following example.

**Example: 2.13** Let  $X = \{a, b, c, d\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{a, b\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}\}$ . Let  $A = \{c, d\}$  then  $\tau_2cl(A) \setminus A = \{a, c, d\} \setminus \{a, d\} = \{c\}$  does not contain nonempty  $\tau_1\tau_2rw$ -closed set in  $X$ , but  $A$  is not  $\tau_1\tau_2\#rg$ -closed set.

**Corollary: 2.14** If a subset  $A$  of  $X$  is an  $\tau_1\tau_2\#rg$ -closed set in  $X$ , then  $\tau_2cl(A) \setminus A$  does not contain any non empty regular closed set in  $X$ , but not conversely.

**Proof:** Follows from theorem 2.7 and the fact that every regular closed set is  $\tau_1\tau_2rw$ -closed.

**Corollary: 2.15** Let  $A$  be  $\tau_1\tau_2\#rg$ -closed in  $(X, \tau_1, \tau_2)$ , Then  $A$  is closed if and only if  $\tau_2cl(A) \setminus A$  is  $\tau_1\tau_2rw$ -closed.

**Proof: Necessity:** Let  $A$  be  $\tau_1\tau_2\#rg$ -closed. By hypothesis  $\tau_2cl(A) \setminus A = \emptyset$  and so  $\tau_2cl(A) \setminus A = \emptyset$  which is  $\tau_1\tau_2rw$ -closed.

**Sufficiency:** Suppose  $\tau_2cl(A) \setminus A$  is  $rw$ -closed. Then by Theorem 2.7,  $\tau_2cl(A) \setminus A = \emptyset$ . That is  $\tau_2cl(A) = A$ . Hence  $A$  is closed.

**Theorem: 2.16** For every point  $x$  of a space  $X$ ,  $X \setminus \{x\}$  is  $\tau_1\tau_2\#rg$ -closed (or)  $\tau_1\tau_2rw$ -open.

**Proof:** Suppose  $X \setminus \{x\}$  is not  $rw$ -open. Then  $X$  is the only  $\tau_1\tau_2rw$ -open set containing  $X \setminus \{x\}$ . This implies  $\tau_2cl(X \setminus \{x\}) \subseteq X$ . Hence  $X \setminus \{x\}$  is  $\tau_1\tau_2\#rg$ -closed.

**Theorem: 2.17** If  $A$  is a  $\tau_1\tau_2\#rg$ -closed subset of  $(X, \tau_1, \tau_2)$  such that  $A \subseteq B \subseteq \tau_2cl(A)$  then  $B$  is also  $\tau_1\tau_2\#rg$ -closed subset of  $(X, \tau_1, \tau_2)$ .

**Proof:** Let  $U$  be a  $\tau_1\tau_2rw$ -open set in  $(X, \tau_1, \tau_2)$  such that  $B \subseteq U$ . Then  $A \subseteq U$ . Since,  $A$  is  $\tau_1\tau_2\#rg$ -closed, then  $\tau_2cl(A) \subseteq U$ . Now, since  $\tau_2cl(A)$  is closed,  $\tau_2cl(B) \subseteq \tau_2cl(\tau_2cl(A)) = \tau_2cl(A) \subseteq U$ . Therefore  $B$  is also  $\tau_1\tau_2\#rg$ -closed.

**Remark:** The converse of the above theorem need not be true in general.

Consider the topological space  $(X, \tau_1, \tau_2)$ , Let  $X = \{a, b, c, d\}$  be with topologies  $\tau_1 = \{\emptyset, X, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{b, c\}, \{a, b, c\}\}$  and  $\tau_2 = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}\}$ . Let  $A = \{c, d\}$  and  $B = \{b, c, d\}$ . Then  $A$  and  $B$  are  $\tau_1\tau_2\#rg$ -closed sets but  $A \subseteq B$  and  $B$  is not a subset in  $\tau_2cl(A)$ .

**Theorem: 2.18** If a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is both  $\tau_1\tau_2rw$ -open and  $\tau_1\tau_2\#rg$ -closed then it is closed.

**Proof:** Suppose a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is both  $\tau_1\tau_2rw$ -open and  $\tau_1\tau_2\#rg$ -closed. Now  $A \subseteq A$ . Then  $\tau_2cl(A) \subseteq A$ . Thus  $A$  is closed.

**Corollary: 2.19** Let  $A$  be  $\tau_1\tau_2rw$ -open and  $\tau_1\tau_2\#rg$ -closed in  $(X, \tau_1, \tau_2)$ . Suppose that  $F$  is closed in  $(X, \tau_1, \tau_2)$ . Then  $A \cap F$  is a  $\tau_1\tau_2\#rg$ -closed set in  $X$ .

**Proof:** Let  $A$  be  $\tau_1\tau_2rw$ -open and  $\tau_1\tau_2\#rg$ -closed in  $(X, \tau_1, \tau_2)$  and  $F$  be closed. By theorem 2.10,  $A$  is closed. So  $A \cap F$  is closed and hence  $A \cap F$  is  $\tau_1\tau_2\#rg$ -closed set in  $(X, \tau_1, \tau_2)$ .

**Theorem: 2.20** If  $A$  is open and  $g$ -closed then  $A$  is  $\tau_1\tau_2\#rg$ -closed.

**Proof:** Let  $A$  be an open and  $\tau_1\tau_2$ g-closed set in  $X$ . Let  $A \subseteq U$  and  $U$  be rw-open in  $X$ . Now  $A \subseteq A$ . By hypothesis  $\tau_2\text{cl}(A) \subseteq A$ . That is  $\tau_2\text{cl}(A) \subseteq U$ . Thus  $A$  is  $\tau_1\tau_2$ #rg-closed.

**Remark:**

1. If  $A$  is  $\tau_1\tau_2$ regular open and  $\tau_1\tau_2$ rg-closed then  $A$  is  $\tau_1\tau_2$ #rg-closed set.
2. If  $A$  is  $\tau_1\tau_2$ g-open open and  $\tau_1\tau_2$ g\*-closed then  $A$  is  $\tau_1\tau_2$ #rg-closed set.
3. If  $A$  is  $\tau_1\tau_2$   $\pi$ - open and  $\tau_1\tau_2$ pg-closed then  $A$  is  $\tau_1\tau_2$ #rg-closed set.
4. If  $A$  is  $\tau_1\tau_2$ semi open and  $\tau_1\tau_2$ w-closed then  $A$  is  $\tau_1\tau_2$ #rg-closed set.
5. If  $A$  is  $\tau_1\tau_2$ regular semi open and  $\tau_1\tau_2$ rw-closed then  $A$  is  $\tau_1\tau_2$ #rg-closed set.

**Theorem: 2.21** If a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is both open and  $\tau_1\tau_2$ wg-closed then it is  $\tau_1\tau_2$ #rg-closed.

**Proof:** Suppose a subset  $A$  of  $X$  is both open and wg-closed. Let  $A \subseteq U$  with  $U$  is rw-open in  $X$ . Now  $\tau_2\text{cl}(\text{int}(A)) \subseteq A$ . Since  $A$  is open,  $\text{int}(A) = A$ . Then  $\tau_2\text{cl}(\text{int}(A)) = \tau_2\text{cl}(A) \subseteq A \subseteq U$ . Hence  $A$  is  $\tau_1\tau_2$ #rg closed set.

**Definition: 2.22** A space  $(X, \tau_1, \tau_2)$  is called a  $T\tau_1\tau_2$ #rg-space if every  $\tau_1\tau_2$ #rg-closed set in it is closed.

**Theorem: 2.23.** A space  $(X, \tau_1, \tau_2)$  is  $T\tau_1\tau_2$ #rg-space if and only if every singleton of  $x$  is either  $\tau_1\tau_2$ rw-closed or open.

**Proof: Necessity:** Let  $x \in X$  be such that  $\{x\}$  is not  $\tau_1\tau_2$ rw-closed. Then  $X \setminus \{x\}$  is not  $\tau_1\tau_2$ rw-open. So  $X$  is the only rw-open set containing  $X \setminus \{x\}$ . This implies that  $X \setminus \{x\}$  is  $\tau_1\tau_2$ #rg-closed. By assumption,  $X \setminus \{x\}$  is closed. Then  $\{x\}$  is open.

**Sufficiency:** Let  $A$  be a  $\tau_1\tau_2$ #rg-closed subset of  $X$  and let  $x \in \tau_2\text{cl}(A)$ . By assumption, we have following cases.

- (1)  $x$  is open, but  $x \in \tau_2\text{cl}(A)$ , so  $x \in A$
  - (2)  $x$  is rw-closed. By theorem 2.7,  $x \notin \tau_2\text{cl}(A) \setminus A$ , but  $x \in \tau_2\text{cl}(A)$  so  $x \in A$ .
- Hence  $\tau_2\text{cl}(A) = A$ . That is  $A$  is closed.

**Theorem: 2.24** Every  $T1 \setminus 2$ -space is  $T\tau_1\tau_2$ #rg-space, but not conversely.

**Proof:** Let  $X$  be a  $T1 \setminus 2$ -space and  $A$  be a  $\tau_1\tau_2$ #rg-closed set in  $X$ . We have, every  $\tau_1\tau_2$ #rg-closed set is g-closed. Hence  $A$  is g-closed. Since it is a  $T1 \setminus 2$ -space,  $A$  is closed in  $X$ . Hence  $X$  is  $T\tau_1\tau_2$ #rg-space.
