DEPARTMENT OF MATHEMATICS, GOVERNMENT ARTS COLLEGE, COIMBATORE-641018.

Abstract. The aim of this paper is to introduce -compactness and -connectedness in intuitionistic topological spaces. Also some of their fundamental properties are investigated.

1. Introduction

Coker[2] after the introduction of the concept of intuitionistic sets and intuition-istic topological spaces studied some properties of intuitionistic continuity and in-tuitionistic compactness. Dogan Coker and Selma Ozcag initiated connectedness in intuitionistic topological spaces. Further, several researchers [6,8,10] studied some weak forms of intuitionistic topological spaces. In this paper some properties of in-tuitionistic -compactness and -connectedness in intuitionistic topological spaces are studied.

2. Preliminaries

De nition 2.1. [4] An intuitionistic set A is an object having the form $\langle hX; A_1; A_2 \rangle$ where A_1 and A_2 are subsets of X satisfying $A_1 \cap A_2 = \emptyset$. The set A_1 is called the set of members of A, while A_2 is called the set of non-members of A. Furthermore, let $\{A_i : i \in I\}$ be an arbitrary family of intuitionistic sets in X,

where $A_i = \langle hX; A_1^i; A_2^i \rangle$ then $\bigcup_{i \in I} A_i = \langle hX; \bigcup_{i \in I} A_1^i; \bigcap_{i \in I} A_2^i \rangle$
 $\bigcap_{i \in I} A_i = \langle hX; \bigcap_{i \in I} A_1^i; \bigcup_{i \in I} A_2^i \rangle$
 $A \cup B = \langle hX; A_1 \cup B_1; A_2 \cap B_2 \rangle$
 $A \cap B = \langle hX; A_1 \cap B_1; A_2 \cup B_2 \rangle$

$[A] = \langle hX; A_1^c; A_2 \rangle$
 $\bigcup_{i \in I} [A_i] = [\bigcap_{i \in I} A_i]$
 $\bigcap_{i \in I} [A_i] = [\bigcup_{i \in I} A_i]$

De nition 2.2. [4] An intuitionistic topological space on a nonempty set X is a family of intuitionistic sets in X satisfying the following axioms:

- (T1) $\emptyset, X \in \mathcal{I}$
- (T2) $G_1 \cup G_2 \in \mathcal{I}$ for $G_1, G_2 \in \mathcal{I}$
- (T3) $\bigcap_{i \in J} G_i \in \mathcal{I}$ for any arbitrary family $\{G_i : i \in J\}$

T.A.ALBINAA¹ AND GNANAMBAL ILANGO² ¹RESEARCH SCHOLAR, DEPARTMENT OF MATHEMATICS, GOVERNMENT A

In this case the pair $(X; \mathcal{I})$ is called intuitionistic topological space and any intuitionistic set in \mathcal{I} is known as an intuitionistic open set in X, and the complement of an intuitionistic open set in X is intuitionistic closed.

De nition 2.3. [7] Let $(X; \mathcal{I})$ be an intuitionistic topological space. An intuition-istic set A of X is said to be Intuitionistic semiopen if $A \subseteq \text{Int}(\text{Cl}(A))$ Intuitionistic preopen if $A \subseteq \text{Int}(\text{Cl}(A))$ Intuitionistic regular open if $A = \text{Int}(\text{Cl}(A))$

The family of all intuitionistic preopen and intuitionistic regular open sets of $(X; \mathcal{I})$ are denoted by $\text{IP OS}(X)$ and $\text{IROS}(X)$ respectively.

De nition 2.4. [4] Let $(X; \mathcal{I})$ be an intuitionistic topological space and

Let $A = \{A_i\}_{i \in I}$ be an intuitionistic set in X . Then the several topologies generated by (X, τ) are

- $\tau_0 = \{A : A \in \tau\}$
- $\tau_1 = \{A : A \in \tau, A \neq \emptyset\}$
- $\tau_2 = \{A : A \in \tau, A \neq X\}$
- $\tau_3 = \{A : A \in \tau, A \neq \emptyset, A \neq X\}$
- $\tau_4 = \{A : A \in \tau, A \neq \emptyset, A \neq X, A \neq \{x\}\}$
- $\tau_5 = \{A : A \in \tau, A \neq \emptyset, A \neq X, A \neq \{x\}, A \neq \{y\}\}$

Definition 2.5. [4]

If $B = \{B_j\}_{j \in J}$ is an intuitionistic set in Y , then the preimage of B under f , denoted by $f^{-1}(B)$, is the intuitionistic set in X defined by

$$f^{-1}(B) = \{f^{-1}(B_j)\}_{j \in J}$$

If $A = \{A_i\}_{i \in I}$ is an intuitionistic set in X , then the image of A under f , denoted by $f(A)$ is the intuitionistic set in Y defined by

$$f(A) = \{f(A_i)\}_{i \in I} \text{ where } f(A_i) = \bigcup_{x \in A_i} f(x).$$

Definition 2.6. [8] Let (X, τ) be an intuitionistic topological space. Then X is called intuitionistic disconnected if there exists intuitionistic open sets $A \neq \emptyset$ and

$B \neq \emptyset$ such that $A \cup B = X$ and $A \cap B = \emptyset$. X is called intuitionistic connected if X is not intuitionistic disconnected.

Definition 2.7. [9] An intuitionistic topological space X is called intuitionistic C_5 -disconnected if there exists an intuitionistic set A which is both intuitionistic open and intuitionistic closed such that $\emptyset \neq A \neq X$. X is called intuitionistic C_5 -connected, if X is not C_5 -disconnected.

3. Intuitionistic I -Compactness in Intuitionistic Topological Spaces

Definition 3.1. Let (X, τ) be an ITS. If a family $\{G_i^1, G_i^2 : i \in K\}$ of intuitionistic τ -open sets in X satisfies the condition $\bigcup_{i \in K} G_i^1 \cup \bigcup_{i \in K} G_i^2 = X$ then it is called an intuitionistic τ -open cover (briefly I -open cover).

A finite subfamily of an intuitionistic τ -open cover $\{G_i^1, G_i^2 : i \in K\}$ of X , is also an intuitionistic τ -open cover of X is called a finite subcover of

$$\{G_i^1, G_i^2 : i \in K\}.$$

Definition 3.2. An ITS (X, τ) is said to be intuitionistic τ -compact (I-compact) if each intuitionistic τ -open cover has a finite subcover.

Definition 3.3. Let (X, τ) be an ITS and A be an intuitionistic set in X . The family $\{G_i^1, G_i^2 : i \in K\}$ of intuitionistic τ -open sets in X is called an intuitionistic τ -open cover of A if $A \subseteq \bigcup_{i \in K} G_i^1 \cup \bigcup_{i \in K} G_i^2$.

ON COMPACTNESS AND CONNECTEDNESS IN INTUITIONISTIC TOPOLOGICAL SPACES3

Definition 3.4. An intuitionistic set $A = \{x \in X; A_1; A_2\}$ in an intuitionistic topological space $(X; \tau)$ is called intuitionistic τ -compact if and only if every intuitionistic τ -open cover of A has a finite subcover. Also an intuitionistic set $A = \{x \in X; A_1; A_2\}$

in $(X; \tau)$ is intuitionistic τ -compact if for each family $\{G_i = \{x \in X; G_i^1; G_i^2\} : i \in K\}$ of intuitionistic τ -open sets in X , $A \subseteq \bigcup_{i \in K} G_i$ and there exists a finite subfamily $\{G_i : i = 1; 2; \dots; n\}$ of $\{G_i\}$ such that $A \subseteq \bigcup_{i=1}^n G_i$ and $A \subseteq \bigcap_{i=1}^n G_i$.

Theorem 3.5. Let $(X; \tau)$ be an intuitionistic topological space. Then $(X; \tau)$ is intuitionistic τ -compact if the intuitionistic topological space $(X; \tau_0)$ is intuitionistic τ -compact.

Proof. Necessity: Let $(X; \tau)$ be intuitionistic τ -compact and consider an intuitionistic τ_0 -open cover $\{G_j : j \in K\}$ of X in $(X; \tau_0)$. Since $\bigcup_{j \in K} G_j = X$, we obtain $\bigcup_{j \in K} G_j^1 = X$ and hence $\bigcup_{j \in K} G_j^2 \cup \bigcup_{j \in K} G_j^1 \cup \bigcup_{j \in K} G_j^2 = X$. Since $(X; \tau)$ is intuitionistic τ -compact, there exists G_1, G_2, \dots, G_n such that $\bigcup_{i=1}^n G_i = X$ which implies $\bigcup_{i=1}^n G_i^1 = X$ and $\bigcup_{i=1}^n G_i^2 = X$. So $(X; \tau_0)$ is intuitionistic τ_0 -compact.

Sufficiency: Suppose $(X; \tau_0)$ is intuitionistic τ_0 -compact. Consider an intuitionistic τ -open cover $\{G_j : j \in K\}$ of X in $(X; \tau)$. Since $\bigcup_{j \in K} G_j = X$, $\bigcup_{j \in K} G_j^1 = X$ and hence $\bigcup_{j \in K} G_j^2 \cup \bigcup_{j \in K} G_j^1 \cup \bigcup_{j \in K} G_j^2 = X$. Since $(X; \tau_0)$ is intuitionistic τ_0 -compact, there exists G_1, G_2, \dots, G_n such that $\bigcup_{i=1}^n G_i^1 = X$ and $\bigcup_{i=1}^n G_i^2 = X$. Hence $\bigcup_{i=1}^n G_i = X$. Thus $(X; \tau)$ is intuitionistic τ -compact.

Theorem 3.6. The intuitionistic topological space $(X; \tau)$ is intuitionistic τ -compact if the intuitionistic topological space $(X; \tau_1)$ is intuitionistic τ_1 -compact.

Proof. Similar to the Theorem 3.5.

Theorem 3.7. Intuitionistic τ -continuous image of an intuitionistic τ -compact space is intuitionistic compact.

Proof. Let $f : (X; \tau) \rightarrow (Y; \tau_1)$ be intuitionistic τ -continuous from an intuitionistic τ -compact space X onto intuitionistic topological space Y . Let $\{G_i^1; G_i^2 : i \in K\}$ be an intuitionistic open cover of Y . Then $\{f^{-1}(G_i^1); f^{-1}(G_i^2) : i \in K\}$ is an intuitionistic τ -open cover of X . Since X is intuitionistic τ -compact, there exists $f^{-1}(G_1^1); f^{-1}(G_2^1); \dots; f^{-1}(G_n^1)$. Since f is onto, $\{f(G_1^1); f(G_2^1); \dots; f(G_n^1)\}$ is an intuitionistic open cover of Y , which is finite. Therefore Y is intuitionistic compact.

Theorem 3.8. Every intuitionistic τ -compact space is intuitionistic compact.

Proof. Let X be intuitionistic τ -compact. Let $\{G_i^1; G_i^2 : i \in K\}$ be an intuitionistic τ -open cover of X as every intuitionistic τ -compact, intuitionistic τ -open cover $\{G_i^1; G_i^2 : i \in K\}$ of X has a

finite subcover of X . Hence X is intuitionistic compact.

Definition 3.9. An intuitionistic topological space $(X; \tau)$ is said to be IT τ -space if every intuitionistic τ -closed set in $(X; \tau)$ is intuitionistic closed.

Theorem 3.10. If $(X; \tau)$ is intuitionistic compact and IT τ -space then $(X; \tau)$ is intuitionistic τ -compact.

4T.A.ALBINAA¹ AND GNANAMBAL ILANGO² ¹RESEARCH SCHOLAR, DEPARTMENT OF MATHEMATICS, GOVERNMENT A

Proof. Let $X; G_i^1; G_i^2 : i \in K$ be an intuitionistic τ -open cover of X . Since $(X; \tau)$ is IT- τ -space, $X; G_i^1; G_i^2 : i \in K$ is an intuitionistic open cover of X . As X is intuitionistic compact, intuitionistic open cover $X; G_i^1; G_i^2 : i \in K$ of X

has a finite subcover. Hence $(X; \tau)$ is intuitionistic τ -compact.

Definition 3.11. The function f is said to be intuitionistic τ -continuous if $f^{-1}(V)$ is intuitionistic τ -open in $(X; \tau)$ for every intuitionistic open set V of $(Y; \sigma)$.

Theorem 3.12. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic τ -continuous map from an intuitionistic τ -compact space $(X; \tau)$ onto an intuitionistic topological space $(Y; \sigma)$. If $(Y; \sigma)$ is IT- τ -space then Y is intuitionistic τ -compact.

Proof. Let $X; G_i^1; G_i^2 : i \in K$ be an intuitionistic τ -open cover of Y . Since Y is IT- τ -space, $X; G_i^1; G_i^2 : i \in K$ is an intuitionistic open cover of Y . As f is intuitionistic τ -continuous, $f^{-1}(G_i) : i \in K$ is an intuitionistic τ -open cover of X . Since X is intuitionistic τ -compact, $f^{-1}(G_i) : i \in K$ has a finite subcover. Hence $G_i : i \in K$ is a finite subcover of $X; G_i^1; G_i^2 : i \in K$ of Y . Therefore Y is intuitionistic τ -compact.

Theorem 3.13. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be surjective intuitionistic τ -continuous map. If $(X; \tau)$ is intuitionistic τ -compact then $(Y; \sigma)$ is intuitionistic compact.

Proof. Let $X; G_i^1; G_i^2 : i \in K$ be an intuitionistic open cover of Y . As f is intuitionistic τ -continuous, $f^{-1}(G_i) : i \in K$ is an intuitionistic τ -open cover of X . Since X is intuitionistic τ -compact, it has a finite subcover. Hence $G_i : i \in K$ is an open cover of Y and hence $(Y; \sigma)$ is intuitionistic compact.

Definition 3.14. A mapping $f : (X; \tau) \rightarrow (Y; \sigma)$ is said to be intuitionistic τ -irresolute if the inverse image of every intuitionistic open set of Y is intuitionistic τ -open in X .

Theorem 3.15. If $f : (X; \tau) \rightarrow (Y; \sigma)$ is an intuitionistic τ -irresolute mapping and A is intuitionistic τ -compact relative to X , then $f(A)$ is intuitionistic τ -compact relative to Y .

Proof. Let $fG_i : i \in K$ be an intuitionistic τ -open set of Y such that $f(A) \subseteq \bigcup_{i \in K} fG_i$. Then $A \subseteq \bigcup_{i \in K} f^{-1}(G_i) : i \in K$ where $f^{-1}(G_i)$ is intuitionistic τ -open in X for each i . Since A is intuitionistic τ -compact relative to X , there exists a finite subcollection $fG_1; G_2; \dots; G_n$ such that $A \subseteq \bigcup_{i=1}^n f^{-1}(G_i) : i = 1; 2; \dots; n$. Hence $f(A)$ is intuitionistic τ -compact relative to Y .

Theorem 3.16. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic τ -irresolute mapping. If X is intuitionistic τ -compact, then Y is also an intuitionistic τ -compact space.

Proof. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic τ -irresolute mapping from an intuitionistic τ -compact space X onto an intuitionistic topological space Y . Let $f(G_i) : i \in K$ be an intuitionistic τ -open cover of Y . Then $f^{-1}(G_i) : i \in K$ is an intuitionistic τ -open cover of X . Since X is intuitionistic τ -compact, there is a finite subfamily $f^{-1}(A_{i1}); f^{-1}(A_{i2}); \dots; f^{-1}(A_{in})$ of $f^{-1}(A_i) : i \in K$ such that

ON -COMPACTNESS AND -CONNECTEDNESS IN INTUITIONISTIC TOPOLOGICAL SPACES5

$[\bigcup_{j=1}^n G_{ij}] = X$: Since f is onto, $f(X) = X$ and $f^{-1}[\bigcup_{j=1}^n f^{-1}(G_{ij})] = [\bigcup_{j=1}^n f^{-1} f^{-1}(G_{ij})]$

$= [\bigcup_{j=1}^n G_{ij}]$. It follows that $[\bigcup_{j=1}^n G_{ij}] = X$ and the family $fG_{i1}; G_{i2}:::G_{in}$ is an intuitionistic finite subcover of $fG_i : i \in \mathbb{N}$. Hence Y is intuitionistic -compact.

Definition 3.17. A function $f : (X; \tau) \rightarrow (Y; \sigma)$ is said to be strongly intuitionistic -continuous (briefly strongly I -continuous) if the preimage of every intuitionistic -open set of Y is intuitionistic open in X .

Theorem 3.18. If $f : (X; \tau) \rightarrow (Y; \sigma)$ is strongly intuitionistic -continuous from an intuitionistic compact space X onto an intuitionistic topological space Y , then

Y is intuitionistic -compact.

Proof. Let $X; G_1^1; G_1^2; \dots; G_n^2 : i \in \mathbb{N}$ be an intuitionistic -open cover of Y . Since f is strongly intuitionistic -continuous, $f^{-1}(G_i^1); i \in \mathbb{N}$ is an intuitionistic open cover of X . Since X is intuitionistic

compact, there exists a finite subcover $f^{-1}(G_1^1); f^{-1}(G_2^1); \dots; f^{-1}(G_n^1)$ such that $[\bigcup_{i=1}^n f^{-1}(G_i^1)] = X$ and $[\bigcup_{i=1}^n f^{-1}(G_i^2)] = f(X)$ which implies $[\bigcup_{i=1}^n G_i^1] = f(X)$ and $[\bigcup_{i=1}^n G_i^2] = f(X)$. Hence $Y = [\bigcup_{i=1}^n G_i^1]$ i.e., $fG_1; G_2:::G_n$ is a finite subcover of Y . Hence Y is intuitionistic -compact.

Definition 3.19. An intuitionistic function $f : (X; \tau) \rightarrow (Y; \sigma)$ is said to be perfectly intuitionistic -continuous if the inverse image of every intuitionistic -open set in Y is both intuitionistic open and intuitionistic closed in $(X; \tau)$.

Theorem 3.20. If $f : (X; \tau) \rightarrow (Y; \sigma)$ is perfectly intuitionistic -continuous from an intuitionistic compact space X onto an intuitionistic topological space Y , then

Y is intuitionistic -compact.

Proof. Since every perfectly intuitionistic -continuous is strongly intuitionistic -continuous, by previous Theorem, Y is intuitionistic -compact.

Theorem 3.21. The image of an intuitionistic -compact space under a strongly intuitionistic -continuous function is intuitionistic -compact.

Proof. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be strongly intuitionistic -continuous function from an intuitionistic -compact space onto an intuitionistic topological space Y . Let

$X; G_1^1; G_2^2; \dots; G_n^2 : i \in \mathbb{N}$ be an intuitionistic -open cover of Y . Then $f^{-1}(G_i^1); i \in \mathbb{N}$ is an intuitionistic open cover of X as f is strongly intuitionistic -continuous and so $f^{-1}(G_i); i \in \mathbb{N}$ is an intuitionistic -open cover of X . Since X is intuitionistic -compact, the intuitionistic -open cover $f^{-1}(G_i); i \in \mathbb{N}$ of X has a finite subcover $f^{-1}(G_1); f^{-1}(G_2); \dots; f^{-1}(G_n)$ such that $[\bigcup_{i=1}^n f^{-1}(G_i^1)] = X$ and $[\bigcup_{i=1}^n f^{-1}(G_i^2)] = f(X)$. Hence $Y = [\bigcup_{i=1}^n G_i^1]$ i.e., $fG_1; G_2:::G_n$ is a finite subcover of Y . Hence Y is intuitionistic -compact.

Theorem 3.22. The image of an intuitionistic -compact space under an intuitionistic -irresolute map is intuitionistic -compact.

Proof. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be intuitionistic -irresolute map from an intuitionistic -compact space X onto an intuitionistic topological space Y . Let

$X; G_1^1; G_2^2; \dots; G_n^2 : i \in \mathbb{N}$ be an intuitionistic -open cover of Y . Then $f^{-1}(G_i^1); i \in \mathbb{N}$ is an intuitionistic -open cover of X (since f is intuitionistic -irresolute). As X is intuitionistic -compact, the intuitionistic -open cover $f^{-1}(G_i); i \in \mathbb{N}$ of X has a finite subcover $f^{-1}(G_1); f^{-1}(G_2); \dots; f^{-1}(G_n)$. Therefore $[\bigcup_{i=1}^n f^{-1}(G_i^1)] = f(X)$ and

6T.A.ALBINAA¹ AND GNANAMBAL ILANGO² ¹RESEARCH SCHOLAR, DEPARTMENT OF MATHEMATICS, GOVERNMENT A

$\bigcup_{i=1}^n (G_i^2) = f(\dots)$. Thus $fG_1; G_2; \dots; G_n$ is a finite subcover of $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ of Y . Hence Y is intuitionistic ω -compact.

Definition 3.23. An intuitionistic topological space $(X; \tau)$ is called intuitionistic ω -Lindelof if every intuitionistic ω -open cover of X contains a countable subcover.

Theorem 3.24. Every intuitionistic ω -Lindelof space is intuitionistic Lindelof.

Proof. Let $(X; \tau)$ be intuitionistic ω -Lindelof space. Let $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ be an intuitionistic open cover of X . Then $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ is an intuitionistic ω -open cover of X . Since X is intuitionistic ω -Lindelof space, the intuitionistic ω -open cover $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ of X has a countable subcover. Hence X is intuitionistic Lindelof.

Theorem 3.25. If X is intuitionistic Lindelof and IT -space then X is intuitionistic ω -Lindelof space.

Proof. Let $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ be an intuitionistic ω -open cover of X . Then $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ is an intuitionistic open cover of X . Since X is IT -space and X is an intuitionistic Lindelof space, the open cover $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ of X has a countable subcover. Hence X is intuitionistic ω -Lindelof.

Theorem 3.26. Every intuitionistic ω -compact space is intuitionistic ω -Lindelof space.

Proof. Let X be an intuitionistic ω -compact space. Let $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ be an intuitionistic ω -open cover of X . Then $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ has a finite subcover which is always a countable subcover, $fG_1; G_2; \dots; G_n$ is a countable subcover of $fG_1; G_2; \dots; G_n$ of X . Therefore X is an intuitionistic ω -Lindelof space.

Theorem 3.27. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic ω -continuous surjection and X be intuitionistic ω -Lindelof space then Y is a Lindelof space.

Proof. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic ω -continuous surjection and X be intuitionistic ω -Lindelof. Let $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ be an intuitionistic open cover of X . Since X is intuitionistic ω -Lindelof, $f^{-1}(G_i) : i \in \mathbb{N}$ contains a countable subcover, $f^{-1}(G_{i_n}) : i_n \in \mathbb{N}$. Then G_{i_n} is a countable subcover of Y . Thus Y is intuitionistic Lindelof.

Theorem 3.28. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic ω -irresolute surjection and X be intuitionistic ω -Lindelof then Y is intuitionistic ω -Lindelof space.

Proof. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic ω -irresolute surjection and X be intuitionistic ω -Lindelof. Let $X; G_1^1; G_2^2; \dots; G_n^n : i \in \mathbb{N}$ be an intuitionistic ω -open cover of X . Since X is intuitionistic ω -Lindelof, $f^{-1}(G_i) : i \in \mathbb{N}$ contains a countable subcover, $f^{-1}(G_{i_n}) : i_n \in \mathbb{N}$. Then fG_{i_n} is a countable subcover of Y . Thus Y is intuitionistic ω -Lindelof.

Definition 3.29. An intuitionistic function $f : (X; \tau) \rightarrow (Y; \sigma)$ is said to be intuitionistic ω -open if the image $f(A)$ is intuitionistic ω -open in Y for every intuitionistic ω -open set A in $(X; \tau)$.

ON -COMPACTNESS AND -CONNECTEDNESS IN INTUITIONISTIC TOPOLOGICAL SPACES7

Theorem 3.30. If $f : (X; \tau) \rightarrow (Y; \sigma)$ is intuitionistic τ -open function and Y is intuitionistic σ -Lindelof space, then X is intuitionistic Lindelof.

Proof. Let $\{G_i : i \in K\}$ be an intuitionistic τ -open cover of X . Then $\{f(G_i) : i \in K\}$ be intuitionistic σ -open cover of Y . Since Y is intuitionistic σ -Lindelof, $\{f(G_i) : i \in K\}$ contains a countable subcover, $\{f(G_{i_n})\}_{n \in \mathbb{N}}$. Then $\{G_{i_n}\}_{n \in \mathbb{N}}$ is a countable subcover of X . Thus X is intuitionistic Lindelof.

4. Intuitionistic τ -Connectedness In Intuitionistic Topological Spaces

Definition 4.1. An intuitionistic topological space X is called intuitionistic τ -disconnected (briefly τ -disconnected) if there exists an intuitionistic τ -open sets $A \neq \emptyset$ and $B \neq \emptyset$ such that $A \cup B = X$ and $A \cap B = \emptyset$. X is called intuitionistic τ -connected, if X is not intuitionistic τ -disconnected.

Definition 4.2. An intuitionistic topological space X is called intuitionistic C_5 -disconnected (briefly C_5 -disconnected) if there exists an intuitionistic set A which is both intuitionistic τ -open and intuitionistic τ -closed such that $\emptyset \neq A \neq X$. X is called intuitionistic C_5 -connected, if X is not intuitionistic C_5 -disconnected.

Theorem 4.3. Every intuitionistic τ -connected space is intuitionistic τ -connected.

Proof. Since every intuitionistic open set is intuitionistic τ -open, the proof follows.

Remark 4.4. Every intuitionistic connected space need not be intuitionistic τ -connected which is shown in the following example.

Example 4.5. Let X be the set of all positive integers. Consider the intuitionistic sets given by $A_1 = \{x \in X : f_2(x) > 0\}$; $A_2 = \{x \in X : f_3(x) > 0\}$; $A_3 = \{x \in X : f_4(x) > 0\}$; etc $A_n = \{x \in X : f_{n+1}(x) > 0\}$, $n \in \mathbb{N}$. Then $\{A_n : n \in \mathbb{N}\}$ is an intuitionistic topological space which is connected but not intuitionistic τ -connected.

Theorem 4.6. Every intuitionistic C_5 -connected space is intuitionistic C_5 -connected.

Proof. Let $(X; \tau)$ be intuitionistic C_5 -connected space and suppose that $(X; \tau)$ is intuitionistic C_5 -disconnected. Then there exists a proper intuitionistic set A such that A is both intuitionistic open and intuitionistic closed. Since every intuitionistic open set is intuitionistic τ -open and every intuitionistic closed set is intuitionistic τ -closed, X is intuitionistic C_5 -disconnected which is a contradiction. Hence every intuitionistic C_5 -connected space is intuitionistic C_5 -connected.

Remark 4.7. Every intuitionistic C_5 -connected space need not be intuitionistic C_5 -connected which is shown in the following example.

Example 4.8. Let $X = \{a, b, c, g, f\}$; $X = \{hX\}$; f_a, b, g, f, hX ; f_b, g, f, hX ; $f_a, c, g, f, b, g, f, hX$; f_c, g, f, b, g, f, hX ; f_b, c, g, f, hX ; $f_c, g, f, a, b, g, f, hX$ which is intuitionistic C_5 -connected but not intuitionistic C_5 -connected.

Theorem 4.9. Every intuitionistic C_5 -connected space is intuitionistic τ -connected.

8T.A.ALBINAA¹ AND GNANAMBAL ILANGO² ¹RESEARCH SCHOLAR, DEPARTMENT OF MATHEMATICS, GOVERNMENT A

Proof. Let X be an intuitionistic C_5 -disconnected. Then there exists nonempty disjoint intuitionistic α -open sets A and B in X such that $A \cup B = X$ and $A_2 \setminus B_2 = \emptyset$, $A_1 \setminus B_1 = \emptyset$ and $A_2 \cap B_2 = X$ which implies $A = B$. Hence A is both intuitionistic α -open and intuitionistic α -closed. Hence A is intuitionistic C_5 -connected.

Theorem 4.10. An intuitionistic topological space $(X; \tau)$ is intuitionistic C_5 -connected if there exists no nonempty intuitionistic α -open set A and B in X such that $A = B^c$

Proof. Necessity:

Suppose A and B are intuitionistic α -open sets such that $A \cup B = X$ and $A = B^c$. Since $A = B^c$ and B is an intuitionistic α -open set implies $B^c = A$ is intuitionistic α -closed and $B \cup A = X$. Also $B^c \cup B = X$ implies $A \cup B = X$. Hence there exist a proper intuitionistic α -open set A in X such that A is both intuitionistic α -open and intuitionistic α -closed. But this is a contradiction to the fact that X is intuitionistic C_5 -connected.

Sufficiency:

Let $(X; \tau)$ be an intuitionistic topological space and intuitionistic C_5 -disconnected then there exists an intuitionistic set A which is both intuitionistic α -open and intuitionistic α -closed in X such that $A \cup A^c = X$. Let $B = A^c$, in this case

B is an intuitionistic α -open set and since $A \cup B = X$ which implies $B = A^c \cup B = X$. Hence $A = B^c$ which is a contradiction that there exists no nonempty intuitionistic proper subset of X which is both intuitionistic α -open and intuitionistic α -closed.

Therefore, X is intuitionistic C_5 -connected.

Theorem 4.11. An intuitionistic topological space $(X; \tau)$ is intuitionistic C_5 -connected if there exists no nonempty intuitionistic sets A and B in X such that

$$B = (I \text{cl}(A))^c, B = A^c \text{ and } A = (I \text{cl}(B))^c$$

Proof. Necessity:

Let A and B be any two intuitionistic sets such that $A \cup B = X$, $B = A^c$, $B = (I \text{cl}(A))^c$, $A = (I \text{cl}(B))^c$. Since $(I \text{cl}(A))^c$ and $(I \text{cl}(B))^c$ are intuitionistic α -open sets in X , A and B are intuitionistic α -open sets in X which is a contradiction. Sufficiency:

Let $(X; \tau)$ be an intuitionistic C_5 -disconnected. Then there exists intuitionistic set A which is both intuitionistic α -open and intuitionistic α -closed in X such that

$$A \cup A^c = X. \text{ Taking } B = A^c \text{ we obtain a contradiction.}$$

Theorem 4.12. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic α -continuous surjective function. If X is intuitionistic α -connected, then Y is intuitionistic connected.

Proof. Let Y be intuitionistic disconnected. Then there exist intuitionistic open sets

$E \cup F = Y$, $E \cap F = \emptyset$ in Y such that $E \cap F = \emptyset$, $E \cup F = Y$. Since f is intuitionistic α -continuous, there exists intuitionistic α -open sets $A = f^{-1}(E)$ and $B = f^{-1}(F)$ in X . But $E \cap F = \emptyset$ implies $A \cap B = f^{-1}(E \cap F) = f^{-1}(\emptyset) = \emptyset$ and $E \cup F = Y$ implies $A \cup B = f^{-1}(E \cup F) = f^{-1}(Y) = X$. Hence $A \cup B = X$ and $A \cap B = \emptyset$ implies $f^{-1}(E) \cap f^{-1}(F) = f^{-1}(\emptyset) = \emptyset$ which implies $A \cap B = \emptyset$. Hence X is intuitionistic α -disconnected, which is a contradiction to our hypothesis.

Therefore Y is intuitionistic connected.

Theorem 4.13. Let $f : (X; \tau) \rightarrow (Y; \sigma)$ be an intuitionistic α -irresolute and onto.

If X is intuitionistic α -connected, then Y is intuitionistic α -connected.

ON COMPACTNESS AND CONNECTEDNESS IN INTUITIONISTIC TOPOLOGICAL SPACES9

Proof. Suppose Y is intuitionistic C_1 -connected. Then $Y = A \cup B$ and $A \cap B = \emptyset$ where $A, B \neq \emptyset$ and intuitionistic C_1 -open in Y . Since f is intuitionistic C_1 -irresolute and onto, $X = f^{-1}(A) \cup f^{-1}(B)$ is disjoint nonempty open subset of X . This contradicts the fact that X is intuitionistic C_1 -connected. Hence Y is intuitionistic C_1 -connected.

Theorem 4.14. Let $f : (X, \tau) \rightarrow (Y, \sigma)$ be an intuitionistic C_1 -irresolute surjection and X be intuitionistic C_1 -connected, then Y is also intuitionistic C_1 -connected.

Proof. Let Y be intuitionistic C_1 -disconnected. Then there exist an intuitionistic set A of Y which is both intuitionistic C_1 -open and intuitionistic C_1 -closed. Since f is intuitionistic C_1 -irresolute and surjective, $f^{-1}(A)$ is also an intuitionistic set of X which is both intuitionistic C_1 -open and intuitionistic C_1 -closed. Hence X is not intuitionistic C_1 -connected which is a contradiction. Hence Y intuitionistic C_1 -connected.

Definition 4.15. An intuitionistic topological space (X, τ) is said to be strongly intuitionistic C_1 -connected, if there exists no non-empty intuitionistic C_1 -closed sets A and B in X such that $A \cap B = \emptyset$.

Theorem 4.16. X is strongly intuitionistic C_1 -connected if there exists no intuitionistic C_1 -open sets A and B in X such that $A \cap X \cap B = \emptyset$ and $A \cup B = X$.

Proof. Let A and B be intuitionistic C_1 -open sets in X such that $A \cap X \cap B = \emptyset$ and $A \cup B = X$. If $C = A^c$ and $D = B^c$ then C and D are intuitionistic C_1 -closed sets in X and as $C \cap D = \emptyset$ and $C \cup D = X$, X is strongly intuitionistic C_1 -disconnected.

Theorem 4.17. Let $f : (X, \tau) \rightarrow (Y, \sigma)$ be an intuitionistic C_1 -irresolute surjective function. If X is strongly intuitionistic C_1 -connected, then so is Y .

Proof. Assume Y is not strongly intuitionistic C_1 -connected. Then there exist intuitionistic C_1 -closed sets C and D in Y such that $C \cap D = \emptyset$ and $C \cup D = Y$. Since f is intuitionistic C_1 -irresolute, $f^{-1}(C)$ and $f^{-1}(D)$ are intuitionistic C_1 -closed sets in X and $f^{-1}(C) \cap f^{-1}(D) = \emptyset$, $f^{-1}(C) \cup f^{-1}(D) = X$. So X is strongly intuitionistic C_1 -disconnected, which is a contradiction. Hence Y is strongly intuitionistic C_1 -connected.

Definition 4.18. Let N be an intuitionistic set in an intuitionistic topological space (X, τ) . If there exists intuitionistic C_1 -open sets A and B in X satisfying the following properties then N is called intuitionistic C_1 -disconnected.

- I C_1 : $N = A \cup B$, $A \cap B = \emptyset$, $N^c, N \cap A \neq \emptyset$, $N \cap B \neq \emptyset$
 - I C_2 : $N = A \cup B$, $A \cap B \cap N = \emptyset$, $N \cap A \neq \emptyset$, $N \cap B \neq \emptyset$.
- N is said to be I C_i -connected if N is not I C_i -disconnected.

Example 4.19. Let $X = \{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\}$; $\tau = \{ \emptyset, X, \{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\} \}$. Then the intuitionistic set $\{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\}$ is both intuitionistic C_1 -connected and intuitionistic C_1 -connected.

Example 4.20. Let $X = \{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\}$; $\tau = \{ \emptyset, X, \{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\} \}$. Let $N = \{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\}$ then N is intuitionistic C_2 -connected but not intuitionistic C_1 -connected.

Definition 4.21. The intuitionistic sets A and B in (X, τ) is said to be intuitionistic C_1 -weakly separated (briefly I C_1 -weakly separated) if $I \text{cl}(A) \cap B^c = \emptyset$ and $I \text{cl}(B) \cap A^c = \emptyset$.

10T.A.ALBINAA¹ AND GNANAMBAL ILANGO² RESEARCH SCHOLAR, DEPARTMENT OF MATHEMATICS, GOVERNMENT A

Definition 4.22. The intuitionistic topological space $(X; \tau)$ is said to be intuitionistic C_S -disconnected if there exists an intuitionistic τ -weakly separated non-empty sets A and B in $(X; \tau)$ such that $X = A \cup B$. $(X; \tau)$ is called intuitionistic

C_S -connected if it is not intuitionistic C_S -disconnected

Theorem 4.23. If the intuitionistic closure of the subsets of $(X; \tau)$ are intuitionistic τ -closed, then the nonempty sets A and B are intuitionistic τ -weakly separated if there exists $M, W \in \tau$ such that $A \cap M, B \cap W, A \cap W^c$ and $B \cap M^c$

Proof. Necessity:

Let $I \text{cl}(A) \in \tau^c$ and $I \text{cl}(B) \in \tau^c$ and let $W = (I \text{cl}(A))^c, M = (I \text{cl}(B))^c$ which are intuitionistic τ -open sets in X . Then $W \cap B^c$ and $M \cap A^c$ this implies $A \cap M$ and $B \cap W$. Since $W = (I \text{cl}(A))^c, A \cap W^c$ and $M = (I \text{cl}(B))^c, B \cap M^c$ this implies $B \cap M^c$. Sufficiency:

Let M and W be intuitionistic τ -open sets in X such that $A \cap M, B \cap W, A \cap W^c, B \cap M^c$. Since intuitionistic closure of intuitionistic sets of $(X; \tau)$ are

$$\text{intuitionistic } \tau\text{-closed, } I \text{cl}(A) \cap I \text{cl}(W) = W \text{ and } I \text{cl}(B) \cap I \text{cl}(M) = M$$

$$\text{This implies } I \text{cl}(A) \cap W = A \text{ and } I \text{cl}(B) \cap M = B. \text{ Hence } I \text{cl}(A) \cap B^c$$

$$\text{and } I \text{cl}(B) \cap A^c. \text{ Hence } A \text{ and } B \text{ are intuitionistic } \tau\text{-weakly separated.}$$

Definition 4.24. The intuitionistic set N in the intuitionistic topological space $(X; \tau)$ is said to be intuitionistic C_S -disconnected if there are two non-empty intuitionistic τ -weakly separated sets A and B in $(X; \tau)$ such that $N = A \cup B$. N is called intuitionistic C_S -connected if N is not intuitionistic C_S -disconnected

Theorem 4.25. If $I \text{cl}(A)$ is intuitionistic τ -closed, for every intuitionistic set A in $(X; \tau)$, then N is intuitionistic C_S -connected if N is intuitionistic C_1 -connected

Proof. Let N be intuitionistic C_S -disconnected. Then there exists intuitionistic nonempty sets A and B such that $N = A \cup B$ where A and B are intuitionistic τ -weakly separated. So, $I \text{cl}(A) \in \tau^c, I \text{cl}(B) \in \tau^c$ and $I \text{cl}(A) \cap I \text{cl}(B) \in \tau^c \setminus A^c = (A \cap B)^c = N^c$. Let $P = (I \text{cl}(A))^c$ and $Q = (I \text{cl}(B))^c$. Then P and Q are intuitionistic τ -open sets. Now $N \cap (I \text{cl}(A) \cap I \text{cl}(B))^c = (I \text{cl}(A))^c \cap (I \text{cl}(B))^c = P \cap Q$ this implies $N \cap P \cap Q$. Now, $P \cap Q = (I \text{cl}(A))^c \cap (I \text{cl}(B))^c = (I \text{cl}(A) \cap I \text{cl}(B))^c = (A \cap B)^c = N^c$. If $P \cap N = \emptyset$ then $P \cap N^c = N$ i.e., $A \cap B^c$ which is a contradiction. Hence $P \cap N \neq \emptyset$. Similarly $Q \cap N \neq \emptyset$. Hence P and Q are intuitionistic C_1 -disconnected.
