**Abstract :** In this paper we introduce and study  $g^*\alpha$ -closed sets in topological and Bitopological spaces. Also we discuss some of their properties and investigate the relations between other closed sets in Bitopological Spaces.

## I. INTRODUCTION

In the year 1963, Kelly initiated a systematic study of the concept of bitopological Spaces where  $X$  is the nonempty set and  $\tau_i$  and  $\tau_j$  are two topologies on  $X$ . In 1985, Fukutake introduced and studied the notions of generalized closed( $g$ -closed) sets in bitopological spaces and after that several authors turned their attention towards generalization of various concepts of topology by considering bitopological spaces. We have introduced  $g^*\alpha$ -closed and  $g^*\alpha$ -locally Closed sets in Bitopological Spaces.

## II. PRELIMINARIES:

Before entering into our work we recall the following definitions..

### Definition 2.1:

1. a generalized closed set [7](briefly  $g$ -closed set) if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
2. a generalized star closed set[11] (briefly  $g^*$ -closed set) if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
3.  $g^*\alpha$ -closed if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .

**Definition 2.2** A subset  $A$  of a topology  $(X, \tau_i, \tau_j)$  is called

1.  $(i, j)$ - $g$ -closed[2] if  $\tau_j cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
2.  $(i, j)g^*$ -closed[1]if  $\tau_j cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $\tau_i$ .

## III. $g^*\alpha$ -CLOSED SETS IN BITOPOLOGICAL SPACES

**Definition 3.1:**A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is said to be  $\tau_1 \tau_2$ - $g^*\alpha$  closed if  $\tau_2 - \alpha cl(A) \subseteq U$  whenever  $A \subseteq U$ ,  $U \in G^*O(X, \tau_1)$ . The collection of all  $\tau_1 \tau_2$ - $g^*\alpha$  closed sets of  $(X, \tau_1, \tau_2)$  are denoted by  $G^*\alpha(\tau_1, \tau_2)$ .

**Remark 3.2** By setting  $\tau_1 = \tau_2$  in Definition 3.1, a  $\tau_1 \tau_2$ - $g^*\alpha$  closed set is a  $g^*\alpha$  closed set.

**Definition 3.3** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is said to be  $\tau_2$ - $g^*\alpha$  closed if  $\tau_2 - \alpha cl(A) \subseteq U$  whenever  $A \subseteq U$ ,  $U \in G^*O(X, \tau_1)$ . The collection of all  $\tau_1 \tau_2$ - $g^*\alpha$  closed sets of  $(X, \tau_1, \tau_2)$  are denoted by  $G^*\alpha(\tau_1, \tau_2)$ .

**Remark 3.4** By setting  $\tau_1 = \tau_2$  in Definition 3.1, a  $\tau_1 \tau_2$ - $g^*\alpha$  closed set is a  $g^*\alpha$  closed set.

**Proposition 3.5** If  $A$  is a  $\tau_2 - \alpha$  closed subset of  $(X, \tau_1, \tau_2)$ , then  $A$  is  $\tau_1 \tau_2$ - $g^*\alpha$  closed.

**Proof** Let  $U \in G^*O(X, \tau_1)$  be such that  $A \subseteq U$ . Then by hypothesis,  $\tau_2 - \alpha cl(A) \subseteq U$  and so  $A$  is  $\tau_1 \tau_2$ - $g^*\alpha$  closed.

**Example 3.6** Let  $X = \{1,2,3,4\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{2\}, \{1,2\}, \{2,3\}, \{1,2,3\}\}$  and  $\tau_2 = \{\emptyset, X, \{3\}, \{4\}, \{3,4\}\}$ . Then the set  $A = \{3,4\}$  is  $\tau_1 \tau_2$ - $g^*\alpha$  closed but not  $\tau_2 - \alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

**Proposition 3.7**if  $A$  is both  $\tau_1$ - $g^*$ open and  $\tau_1 \tau_2$ - $g^*\alpha$  closed then  $A$  is  $\tau_2 - \alpha$  closed.

**Proof** If  $A \in G^*O(X, \tau_1)$ , then by hypothesis  $\tau_2 - \alpha cl(A) \subseteq A$ . Therefore  $\tau_2 - \alpha cl(A) = A$  (ie)  $A$  is  $\tau_2 - \alpha$  closed.

**Proposition 3.8** (i) Every  $(i, j)$ - $g$  closed set is  $\tau_1 \tau_2$ - $g^*\alpha$  closed.

(ii) Every  $(i, j)$ - $g^*$ closed set is  $\tau_1 \tau_2$ - $g^*\alpha$  closed.

Proof follows from the Definition 3.1 and from the Definitions of  $(i, j)$ - $g^*$ closed and  $(i, j)$ - $g$  closed sets.

**Example 3.9** Let  $X = \{1,2,3,4\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{1,2\}, \{1,3,4\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1,4\}, \{1,2,4\}\}$ . Here the subset  $\{4\}$  is  $\tau_1 \tau_2$ - $g^*\alpha$  closed but not  $(1,2)$ - $g$  closed.

**Example 3.10** Let  $X = \{1,2,3,4\}$  with  $\tau_1 = \{\emptyset, X, \{2\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1,2\}\}$ . Here the subset  $\{2,4\}$  is  $\tau_1 \tau_2$ - $g^*\alpha$  closed but not  $(1,2)$ - $g^*$ closed.

**Proposition 3.11** If  $A, B \in G^*\alpha(X, \tau_1, \tau_2)$  then  $A \cup B \in G^*\alpha(X, \tau_1, \tau_2)$ .

**Proof** Let  $U$  be a  $\tau_1$ - $g^*$ open set containing  $A \cup B$ . Since  $A, B \in G^*\alpha(X, \tau_1, \tau_2)$ , we have  $\tau_2 - \alpha cl(A) \subseteq U$  and  $\tau_2 - \alpha cl(B) \subseteq U$ . Then  $\tau_2 - \alpha cl(A) \cup \tau_2 - \alpha cl(B) = \tau_2 - \alpha cl(A \cup B) \subseteq U$ . Hence  $A \cup B \in G^*\alpha(X, \tau_1, \tau_2)$ .

**Remark 3.12** The intersection of two  $\tau_1 \tau_2$ - $g^*\alpha$  closed sets is not a  $\tau_1 \tau_2$ - $g^*\alpha$  closed set as seen from the following example.

**Example 3.13** Let  $X = \{1,2,3,4\}$  be endowed  $\tau_1 = \{\emptyset, X, \{1\}, \{1,3\}, \{1,2,4\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{2\}, \{1,2\}\}$ . Here the subset  $\{1,2,3\}$  and  $\{1,3,4\}$  are  $\tau_1 \tau_2$ - $g^*\alpha$  closed sets but  $\{1,2,3\} \cap \{1,3,4\} = \{1,3\}$  is not a  $\tau_1 \tau_2$ - $g^*\alpha$  closed set.

**Remark 3.14**  $G^*\alpha(\tau_1, \tau_2)$  is generally not equal to  $G^*\alpha(\tau_2, \tau_1)$ .

**Example 3.15** Let  $X = \{1,2,3\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{1,2\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}\}$ . Here  $G^*\alpha(\tau_1, \tau_2) \neq G^*\alpha(\tau_2, \tau_1)$ .

**Proposition 3.16** If  $\tau_1 \subseteq \tau_2$  in  $(X, \tau_1, \tau_2)$  then  $G^*\alpha(\tau_2, \tau_1) \subseteq G^*\alpha(\tau_1, \tau_2)$ .

**Proof** Let  $A$  be a  $\tau_2\tau_1$ - $g^*\alpha$  closed set and  $U$  be a  $\tau_1$ - $g^*$ open set containing  $A$ . Since  $\tau_1 \subseteq \tau_2$ , we have  $\tau_2 - \text{acl}(A) \subseteq \tau_1 - \text{acl}(A)$  and  $G^*O(X, \tau_1) \subseteq G^*\alpha(X, \tau_2)$ . Since  $A \in G^*\alpha(\tau_2, \tau_1)$ ,  $\tau_2 - \text{acl}(A) \subseteq U$ ,  $U$  is  $\tau_1$ - $g^*$ open. Thus  $A$  is  $\tau_1\tau_2$ - $g^*\alpha$  closed. Hence  $G^*\alpha(\tau_2, \tau_1) \subseteq G^*\alpha(\tau_1, \tau_2)$ .

**Proposition 3.17** For each  $x$  of a bitopological space  $(X, \tau_1, \tau_2)$ ,  $\{x\}$  is  $\tau_1$ - $g^*$ closed or  $\{x\}^c$  is  $\tau_1\tau_2$ - $g^*\alpha$  closed.

**Proof** Suppose  $\{x\}$  is not  $\tau_1$ - $g^*$ closed. Then  $\{x\}^c$  is not  $\tau_1$ - $g^*$ open. Therefore a  $\tau_1$ - $g^*$ open set containing  $\{x\}^c$  is  $X$  only. Also  $\tau_2 - \text{acl}(\{x\}^c) \subseteq X$ . Hence  $\{x\}^c$  is  $\tau_1\tau_2$ - $g^*\alpha$  closed.

#### IV. $g^*\alpha$ -locally closed sets

in

#### Bitopological Spaces

**Definition 4.1** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called  $\tau_1\tau_2$ - $g^*\alpha$  locally closed (briefly  $\tau_1\tau_2$ - $g^*\alpha$ lc) set if  $A = S \cap F$  where  $S$  is  $\tau_1$ - $g^*\alpha$  open and  $F$  is  $\tau_2$ - $g^*\alpha$  closed in  $(X, \tau_1, \tau_2)$ .

**Definition 4.2** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called  $\tau_1\tau_2$ - $g^*\alpha$  locally closed\* (briefly  $\tau_1\tau_2$ - $g^*\alpha$ lc\*) set if there exists  $\tau_1$ - $g^*\alpha$  open set  $S$  and  $\tau_2$ -closed set  $F$  of  $(X, \tau_1, \tau_2)$  such that  $A = S \cap F$ .

**Definition 4.3** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called  $\tau_1\tau_2$ - $g^*\alpha$  locally closed\*\* (briefly  $\tau_1\tau_2$ - $g^*\alpha$ lc\*\*) set if there exists  $\tau_1$ -open set  $S$  and  $\tau_2$ - $g^*\alpha$  closed set  $F$  of  $(X, \tau_1, \tau_2)$  such that  $A = S \cap F$ .

**Remark 4.4** If  $\tau_1 = \tau_2 = \tau$  in Definitions 4.1, 4.2, 4.3 then  $\tau_1\tau_2$ - $g^*\alpha$ lc (resp  $\tau_1\tau_2$ - $g^*\alpha$ lc\*,  $\tau_1\tau_2$ - $g^*\alpha$ lc\*\*) is a  $g^*\alpha$ lc ( $g^*\alpha$ lc\*,  $g^*\alpha$ lc\*\*) set in a topological space. The collection of all  $\tau_1\tau_2$ - $g^*\alpha$ lc (resp  $\tau_1\tau_2$ - $g^*\alpha$ lc\*,  $\tau_1\tau_2$ - $g^*\alpha$ lc\*\*) sets of  $(X, \tau_1, \tau_2)$  will be denoted by  $\tau_1\tau_2$ - $G^*\alpha$ LC (resp  $\tau_1\tau_2$ - $G^*\alpha$ LC\*,  $\tau_1\tau_2$ - $G^*\alpha$ LC\*\*).

**Example 4.5** Let  $X = \{1, 2, 3, 4\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{2\}, \{1, 2\}, \{1, 2, 3\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3, 4\}\}$ . Then  $\tau_1$ - $g^*\alpha$  open sets in  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\}, \{1, 2, 4\}\}$ .  $\tau_2$ - $g^*\alpha$ -closed sets in  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{2\}, \{3\}, \{4\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{2, 3, 4\}, \{1, 2, 4\}\}$ .

(a)  $\tau_1\tau_2$ - $g^*\alpha$ lc sets in  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{1, 2, 4\}, \{2, 3, 4\}\}$ .

(b)  $\tau_1\tau_2$ - $g^*\alpha$ lc\* sets in  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{1, 2, 4\}, \{2, 3, 4\}\}$ .

(c)  $\tau_1\tau_2$ - $g^*\alpha$ lc\*\* sets in  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{1, 2, 4\}, \{2, 3, 4\}\}$ .

**Theorem 4.6** Let  $A$  be a subset of a space  $(X, \tau_1, \tau_2)$ .

(i) If  $A \in (\tau_1, \tau_2)$ -LC( $X$ ) then  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC,  $\tau_1\tau_2$ - $G^*\alpha$ LC\*,  $\tau_1\tau_2$ - $G^*\alpha$ LC\*\*.

(ii) If  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC\* then  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC.

(iii)  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC\*\* then  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC.

**Proof** Since every closed set is a  $g^*\alpha$ -closed set, the proof follows.

The converse of the above theorem need not be true in general as seen from the following examples.

**Example 4.7**  $X = \{1, 2, 3, 4\}$  with  $\tau_1 = \{\emptyset, X, \{1, 3\}, \{4\}, \{1, 3, 4\}\}$  and  $\tau_2 = \{\emptyset, X, \{2\}\}$ . Then the subset  $\{1, 4\} \in \tau_1\tau_2$ - $G^*\alpha$ LC,  $\tau_1\tau_2$ - $G^*\alpha$ LC\*,  $\tau_1\tau_2$ - $G^*\alpha$ LC\*\* but  $\{1, 4\} \notin (\tau_1, \tau_2)$ -LC( $X$ ).

**Example 4.8**  $X = \{1, 2, 3\}$  with  $\tau_1 = \{\emptyset, X, \{2\}, \{3\}, \{1, 3\}, \{2, 3\}\}$ ,  $\tau_2 = \{\emptyset, X, \{1, 3\}\}$ . Then the subset  $\{1, 2\} \in \tau_1\tau_2$ - $G^*\alpha$ LC but  $\{1, 2\} \notin \tau_1\tau_2$ - $G^*\alpha$ LC\*.

**Example 4.9**  $X = \{1, 2, 3\}$  with  $\tau_1 = \{\emptyset, X, \{2\}, \{2, 3\}\}$ ,  $\tau_2 = \{\emptyset, X, \{1, 2\}\}$ . Then the subset  $\{1\} \in \tau_1\tau_2$ - $G^*\alpha$ LC but  $\{1\} \notin \tau_1\tau_2$ - $G^*\alpha$ LC\*\*.

**Remark 4.10** Every  $\tau_1\tau_2$ - $g^*\alpha$  locally closed set in  $(X, \tau_1, \tau_2)$  are not  $\tau_2$ -closed in general as it can be seen from the following example.

**Example 4.11** In example 4.7,  $\{1, 2, 3\}$  is  $\tau_1\tau_2$ - $g^*\alpha$  locally closed set in  $(X, \tau_1, \tau_2)$  but  $\{1, 2, 3\}$  is not  $\tau_2$ -closed in  $(X, \tau_1, \tau_2)$ .

**Remark 4.12** Every  $\tau_1\tau_2$ - $g^*\alpha$  locally closed set in  $(X, \tau_1, \tau_2)$  are not  $\tau_1$ -open in general as it can be seen from the following example.

**Example 4.13** In example 4.7,  $\{1, 2\}$  is  $\tau_1\tau_2$ - $g^*\alpha$  locally closed set in  $(X, \tau_1, \tau_2)$  but not  $\tau_1$ -open in  $(X, \tau_1, \tau_2)$ .

**Theorem 4.14** (i) If  $A \in \tau_2$ - $g^*\alpha$ -C( $X, \tau_1, \tau_2$ ) then  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC

(ii) If  $A \in \tau_1$ - $g^*\alpha$ -O( $X, \tau_1, \tau_2$ ) then  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC.

**Proof** (i) Since  $A = A \cap X$  and  $A$  is  $\tau_2$ - $g^*\alpha$  closed and  $X$  is  $\tau_1$ - $g^*\alpha$  open in  $(X, \tau_1, \tau_2)$ , we have  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC.

(ii) Since  $A = A \cap X$  and  $A$  is  $\tau_1$ - $g^*\alpha$  open and  $X$  is  $\tau_2$ - $g^*\alpha$  closed in  $(X, \tau_1, \tau_2)$ , we have  $A \in \tau_1\tau_2$ - $G^*\alpha$ LC.

The converses of (i) and (ii) of the above theorem need not be true in general as it can be seen from the following example.

**Example 4.15** Let  $X = \{1, 2, 3, 4\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{2, 3\}, \{1, 2, 3\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1, 2, 4\}\}$ . Then the subset  $\{1\} \in \tau_1\tau_2$ - $G^*\alpha$ LC but  $\{1\} \notin \tau_2$ - $g^*\alpha$ -C( $X, \tau_1, \tau_2$ ) and  $\{2, 3, 4\} \in \tau_1\tau_2$ - $G^*\alpha$ LC but  $\{2, 3, 4\} \notin \tau_1$ - $g^*\alpha$ -O( $X, \tau_1, \tau_2$ ).

#### V. $\tau_1\tau_2$ - $g^*\alpha$ -Submaximal Spaces

**Definition 5.1** A bitopological space  $(X, \tau_1, \tau_2)$  is

(i)  $\tau_1\tau_2$ - $g^*\alpha$  Submaximal space if every  $\tau_1$ -dense subset of  $X$  is  $\tau_2$ - $g^*\alpha$  open in  $X$ .

(ii)  $\tau_2\tau_1$ - $g^*\alpha$  Submaximal space if every  $\tau_2$ -dense subset of  $X$  is  $\tau_1$ - $g^*\alpha$  open in  $X$ .

**Example 5.2** Let  $X = \{1, 2, 3\}$  with  $\tau_1 = \{\emptyset, X, \{1\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\}$ .  $\tau_2$ - $g^*\alpha$  open sets of  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\}$ . Here every  $\tau_1$ -dense subsets of  $(X, \tau_1, \tau_2)$  are  $\tau_2$ - $g^*\alpha$  open sets. Hence it is  $\tau_1\tau_2$ - $g^*\alpha$  Submaximal.

**Example 5.3** Let  $X = \{1, 2, 3\}$  with  $\tau_1 = \{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\}$  and  $\tau_2 = \{\emptyset, X, \{1\}, \{1, 2\}\}$ .  $\tau_1$ - $g^*\alpha$  open sets of  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{1, 2\}, \{1, 3\}\}$ . Here every  $\tau_2$ -dense subsets of  $(X, \tau_1, \tau_2)$  are  $\tau_1$ - $g^*\alpha$  open sets. Hence it is a  $\tau_1\tau_2$ - $g^*\alpha$ -Submaximal space.

**Theorem 5.4** If  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2$ -Submaximal, then  $X$  is  $\tau_1\tau_2$ - $g^*\alpha$  Submaximal space but not conversely.

**Proof** Since  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2$ -Submaximal space, we have every  $\tau_1$ -dense subset of  $X$  is  $\tau_2$ -open in  $X$ . Since every  $\tau_2$ -open set in  $X$  is  $\tau_2$ - $g^*\alpha$  open in  $X$ . Therefore  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2$ - $g^*\alpha$ -Submaximal space.

**Example 5.5** Let  $X = \{1, 2, 3, 4\}$  with  $\tau_1 = \{\emptyset, X, \{2\}, \{1, 2\}\}$  and  $\tau_2 = \{\emptyset, X, \{1, 2\}, \{3, 4\}\}$ . Then  $\tau_1$ -dense subsets of  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{2\}, \{1, 2\}, \{2, 3\}, \{2, 4\}, \{1, 2, 3\}, \{1, 2, 4\}, \{2, 3, 4\}\}$ .  $\tau_2$ - $g^*\alpha$  open sets of  $(X, \tau_1, \tau_2)$  are  $\{\emptyset, X, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{1, 3\}, \{1, 4\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{1, 3, 4\}, \{2, 3, 4\}, \{1, 2, 4\}\}$ . Therefore  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2$ - $g^*\alpha$ -Submaximal but not  $\tau_1\tau_2$ -Submaximal space.

**Theorem 5.6** A bitopological space  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2$ - $g^*\alpha$ -Submaximal Space iff  $\tau_2\tau_1$ - $G^*\alpha$ LC\* = P( $X$ ).

**Proof** Suppose that  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2 - g^*\alpha$  - Submaximal space. Obviously  $\tau_2\tau_1 - G^*\alpha LC^* \subseteq P(X)$ . Let  $A \in P(X)$  and  $U = A \cup \{X - [\tau_1 - cl(A)]\}$ . Since  $\tau_1 - cl(U) = X$ , we have  $U$  is  $\tau_1$ -dense subset of  $X$ . Since  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2 - g^*\alpha$  - Submaximal space, we have  $U$  is  $\tau_2 - g^*\alpha$ -open in  $X$ . Since every  $\tau_2 - g^*\alpha$ -open set in  $X$  is  $\tau_2\tau_1 - g^*\alpha$  locally set in  $(X, \tau_1, \tau_2)$ , we have  $U \in \tau_2\tau_1 - G^*\alpha LC^*$ . Therefore  $P(X) \subseteq \tau_2\tau_1 - G^*\alpha LC^*$ . Hence  $\tau_2\tau_1 - G^*\alpha LC^* = P(X)$ .

Conversely suppose that  $\tau_2\tau_1 - G^*\alpha LC^* = P(X)$ . Let  $A$  be the  $\tau_1$ -dense subset of  $(X, \tau_1, \tau_2)$ . Then  $A \cup \{X - [\tau_1 - cl(A)]\} = A \cup [\tau_1 cl(A)]^c = A$ . Therefore  $A \in \tau_2\tau_1 - G^*\alpha LC^*$  implies that  $A$  is  $g^*\alpha$ - open in  $X$  (by theorem 7.3.18). Hence  $X$  is  $\tau_1\tau_2 - g^*\alpha$  - Submaximal Space.
