## Abstract

Let  $G$  be a Neighbourly Irregular Chemical Graph (NICG). We obtain the Line graph  $L(G)$  from the graph  $G$  for some chemical graph, in which each atoms of  $L(G)$  represents an covalent bonds of  $G$ . In this paper, finding the Irregular Chromatic Number  $\chi_{ir}(G)$  of Line Graph by using different codes and colors. And also, discuss about some examples of Line graph  $L(G)$  and Complete bipartite  $K_{1,n}(G)$  of NIC graph.

**Keywords:** Irregular colouring, line graph, complete bipartite graph.

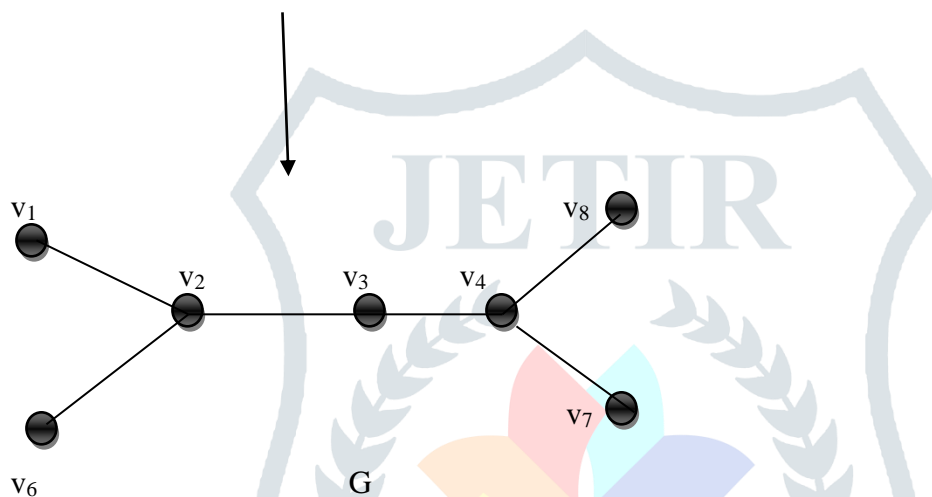

## 1. Introduction

In a graph  $G = (V, E)$  considered as a pair of vertices and edges. Here, we consider the  $V$  as atoms and  $E$  be an covalent bond in chemical term of molecular structure of the Neighbourly Irregular Chemical Graph (NICG) which is finite, undirected, and without loop and isolated atom [1]. Mary Radcliffe and Ping Zhang [2], introduce the concept of irregular colouring of graphs. In 1932, H. Whitney invented the line graph [3]. In this paper, we define the concept of Irregular Chromatic number of line graph of graph (NICG).

## 2. Basic Definitons:

### Definition 2.1

For the molecular structure of chemical graph corresponding element of the atoms has different valency in its adjacent atoms is said to be a Neighbourly Irregular Chemical Graph (NICG).

**Example: 2.1.1****Figure 2.1****Definition 2.2**

Let  $G$  be a graph and let  $V(G)$  be the set of all vertices of  $G$  and let  $\{1,2,\dots,k\}$  be denote the set of all colours which are assigned to each vertex of  $G$ . A proper vertex colouring of a graph  $G$  is a mapping  $c: V(G) \rightarrow \{1,2,\dots,k\}$  such that  $c(u) \neq c(v)$  for all arbitrary adjacent vertices  $u,v \in V(G)$ .

**Definition 2.3**

If distinct vertices have distinct color codes and the colouring  $c$  is called irregular colouring.

**Definition 2.4**

The irregular chromatic number  $\chi_{ir}(G)$  of  $G$  is the minimum positive integer  $k$  for which  $G$  has an irregular  $k$ -colouring. An irregular  $k$ - colouring with  $\chi_{ir}(G) = k$  is a minimum irregular coloring.

**Definition 2.5**

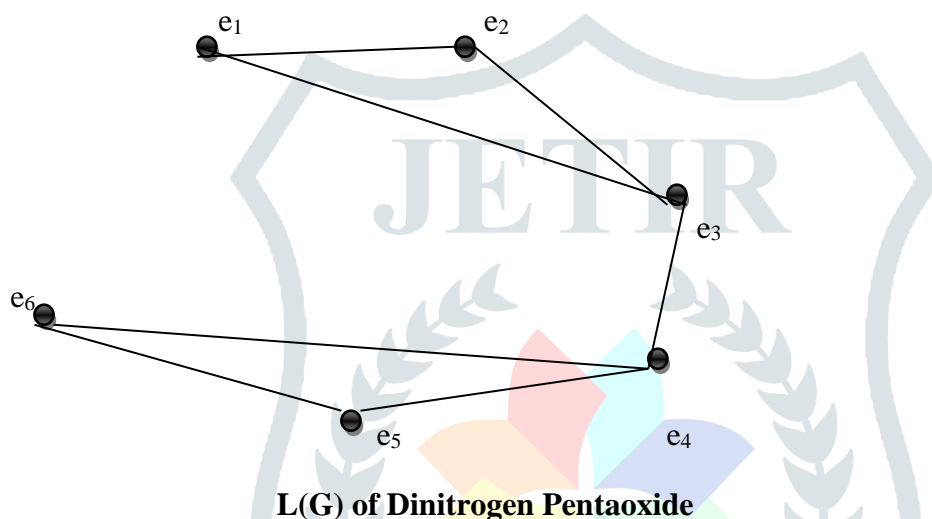

Let  $G = (V, X)$  be a graph. The Complement  $\bar{G}$  of  $G$  is defined to be the graph which has  $V$  as its set of points and two points are adjacent in  $\bar{G}$  if and only if they are not adjacent in  $G$ .

**Definition 2.6**

A graph  $G$  is called a bigraph or bipartite graph if  $V$  can be partitioned into two disjoint subsets  $V_1$  and  $V_2$  such that every line of  $G$  joins a point of  $V_1$  to a point  $V_2$ .  $(V_1, V_2)$  is called a bipartition of  $G$ . If further  $G$  contains every line joining the points  $V_1$  to the points of  $V_2$  then  $G$  is called a complete bigraph.  $K_{1,m}$  is called a star for  $m \geq 1$ .

**Definition 2.7**

A line graph  $L(G)$  (also called an adjoint, covering) of a simple graph  $G$  such that each vertex of  $L(G)$  represents an edge of  $G$  and two vertices of  $L(G)$  are adjacent iff their corresponding edges are incident in  $G$

**Example: 2.1.2****Figure 2.2****3. Irregular Chromatic Number of Line graph of NICG:****Theorem 3.1**

For some line graph of Neighbourly Irregular Chemical Graph its chromtic number  $\chi_{ir}(L(G))$  is either 3 or 4 for  $n \geq 4$  atoms of molecular structure.

**Proof:**

Let  $\{v_1, v_2, v_3, \dots, v_9\}$  be the maximum number of atoms of molecular structure of NIC graph  $G$  of order 9.

And  $\{e_1, e_2, e_3, \dots, e_8\}$  be an covalent bond of graph

Here , covalent bond is considered as atoms of line graph which shown in fig 3.2

$\therefore$  Irregular chromatic number for line graph  $\chi_{ir}(L(G)) = 4$ .

Moreover ,  $\{v_1, v_2, v_3, \dots, v_{10}\}$  be an atom of NIC graph of maximum order 10.

Covalent bond for line graph is  $\{e_1, e_2, e_3, \dots, e_{12}\}$

Here the same process followed as above and shown in fig 3.4

$$\therefore \chi_{ir}(L(G)) = 4.$$

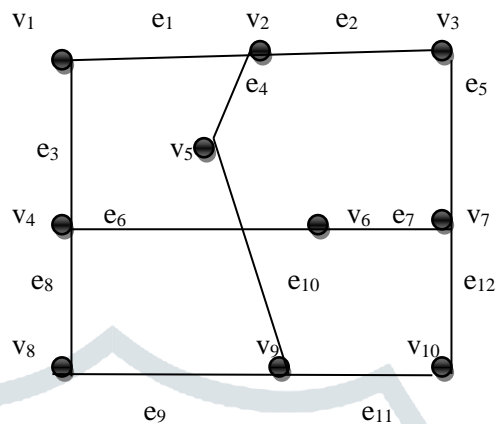

**Figure 3.1**

### 3.2 Irregular Chromatic Number of Line graph of Complete bipartite NICG

#### Theorem 3.2

For every line graph  $L(G)$  of Complete bipartite NIC graph  $G$  of order  $n$ , then  $\chi_{ir}(L(K_{1,m})) = m$   
 $\forall m \geq 3$

#### Proof:

Let  $\{v_1, v_2, v_3, \dots, v_n\}$  be an atom of Complete bipartite NIC graph  $K_{1,n}$  and  $\{e_1, e_2, e_3, \dots, e_n\}$  be an covalent bond of such graph.

This covalent bond are considered as atoms of line graph of Complete bipartite graph  $L(K_{1,m})$ .

For  $m = 3$  atom,

$$\chi_{ir}(L(K_{1,3})) = 3$$

For  $m = 4$  atom,

$$\chi_{ir}(L(K_{1,4})) = 4$$

For  $m = 5$  atom,

$$\chi_{ir}(L(K_{1,5})) = 5$$

It is true for  $m = 4, 5, 6$  atom, and by induction method

Hence the result is true for  $m - 1$ .

Therefore  $\chi_{ir}(L(K_{1,m})) = m$

#### Example:3.2.1

Consider the line graph  $L(G)$  of complete bipartite graph  $K_{1,3}$  of Aluminium hydroxide ( $Al(OH)_3$ )

Aluminium hydroxide ( $Al(OH)_3$ )

Figure 3.5

$$\chi_{ir}(L(K_{1,3})) = 3$$

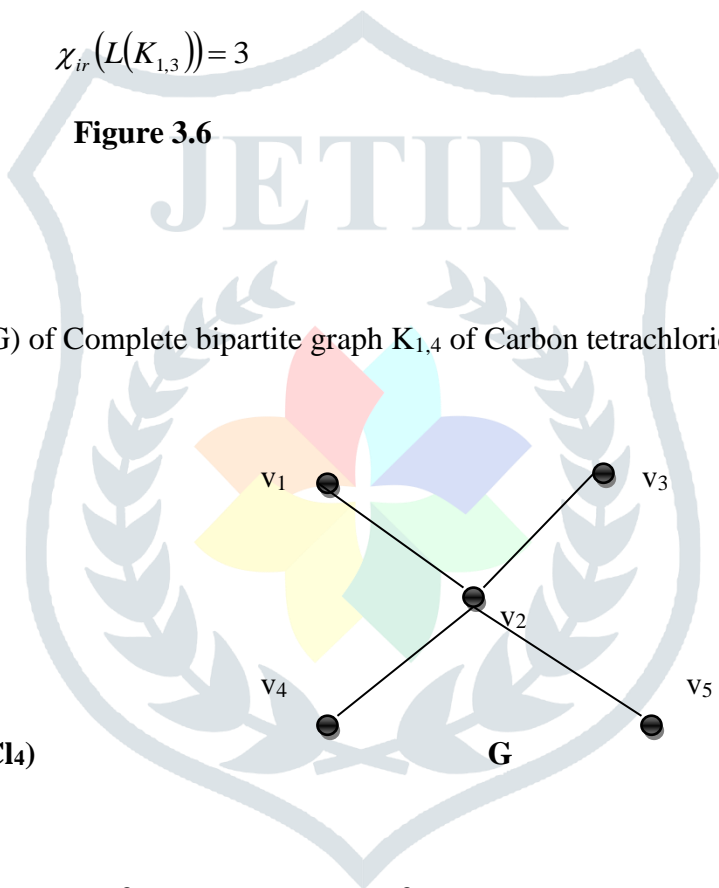

Figure 3.6

**Example:3.2.2**

Consider the line graph  $L(G)$  of Complete bipartite graph  $K_{1,4}$  of Carbon tetrachloride ( $CCl_4$ )

Carbon tetrachloride ( $CCl_4$ )

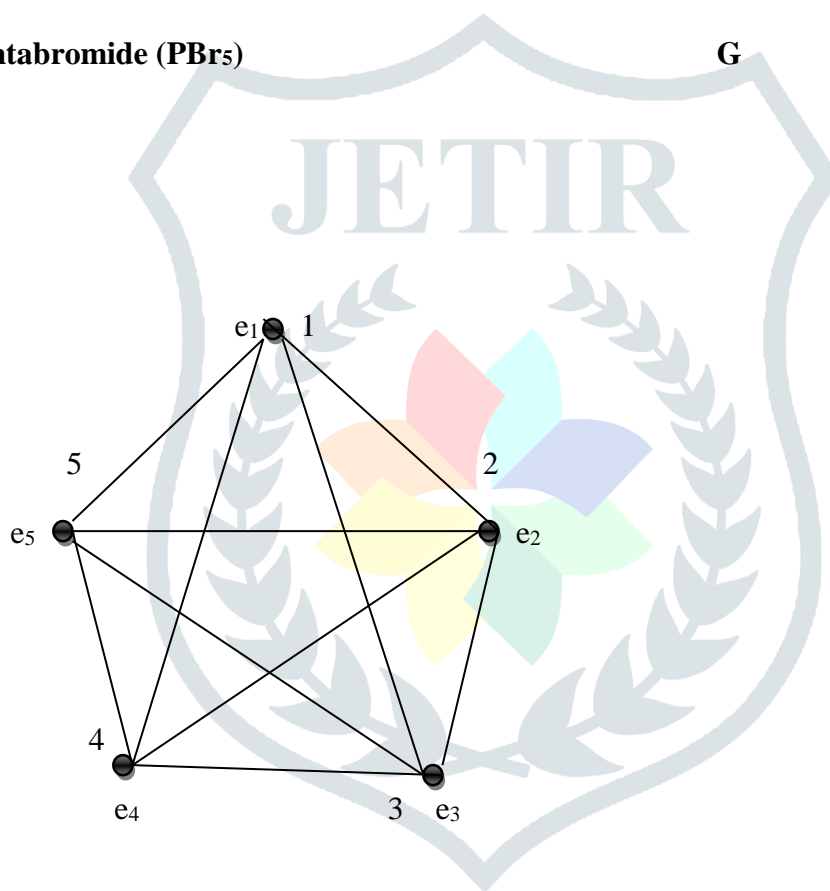

$$\chi_{ir}(L(K_{1,4})) = 4$$

Figure 3.7

**Example:3.2.3**

Consider the line graph  $L(G)$  of complete bipartite graph  $K_{1,5}$  of Phosphorous pentabromide ( $PBr_5$ )

$$\chi_{ir}(L(K_{1,5})) = 5$$

**Figure 3.8**

**Problem :3.3**

If  $L(G)$  and  $L(\overline{G})$  are line graph and its Complement of NIC graph  $G$ , which is molecular structure of Arsenic trioxide ( $As_4O_6$ ), both graph has same irregular chromatic number.

**Solution :**

Let G be an arsenic trioxide which is Neighbourly Irregular Chemical Graph as shown in figure 3.3

Its irregular chromatic number is 2.

The irregular chromatic number for line graph of arsenic trioxide is 4 as shown in figure 3.4

And Complement of L(G) graph of arsenic trioxide is shown figure 3.9 in have valency bond 8 .

$$\chi_{ir}(L(\bar{G})) = 4$$

**Complement of L(G) graph of Arsenic trioxide**

**Figure 3.9**

**Colour codes for Line graph and it's Complement graph:**

Colour codes for each atoms	Line Graph of Arsenic Trioxide	Complement of Line graph of Arsenic Trioxide
c(e <sub>1</sub> )	10210	10233
c(e <sub>2</sub> )	22010	10323
c(e <sub>3</sub> )	22010	22033
c(e <sub>4</sub> )	32100	10332
c(e <sub>5</sub> )	10201	32303
c(e <sub>6</sub> )	31200	23023
c(e <sub>7</sub> )	21011	33203

c(e <sub>8</sub> )	10210	23032
c(e <sub>9</sub> )	22010	43230
c(e <sub>10</sub> )	10120	42330
c(e <sub>11</sub> )	31101	43320
c(e <sub>12</sub> )	41110	33302

Adjacent atom for Line graph and it's Complement graph has distinct codes.

But they has same chromatic number

i.e.)  $\chi_{ir}(L(G)) = 4$ .

$$\chi_{ir}(L(\bar{G})) = 4$$

$$\chi_{ir}(L(G)) = \chi_{ir}(L(\bar{G}))$$

**Observation: 3.4**

Number of atoms of NICG	$\chi_{ir}(L(G))$	Molecular structure name
4	3	Arsenic chloride (AsCl <sub>3</sub> )
5	3	Pentaborane (B <sub>5</sub> H <sub>9</sub> )
6	4	Disulfur tetrafluoride (F <sub>4</sub> S <sub>2</sub> )
7	3	Dinitrogen pentaoxide (N <sub>2</sub> O <sub>5</sub> )
8	4	Diborane (B <sub>2</sub> H <sub>6</sub> )
9	4	Sevoflurane (C <sub>4</sub> H <sub>3</sub> F <sub>7</sub> O)
10	4	Arsenic trioxide (As <sub>4</sub> O <sub>6</sub> )
11	3	Beryllium borohydride (Be(BH <sub>4</sub> ) <sub>2</sub> )

#### 4. Conclusion

In this paper , we consider the Line Graph of Neighbourly Irregular Chemical Graph. Further constructing the Irregular Chromatic number for line graph and its Complement graph of NICG.
