#### Abstract

: Let $G=(V, E)$ be a graph with ' $p$ ' vertices and ' $q$ ' edges. A bijection $f: V(G) \rightarrow\{1,2,3$, $\qquad$ , p$\}$ is said to be prime labeling if for each edge $e=u v$, the labels assigned to $u$ and $v$ are relatively prime. A bijection $f: V(G) \cup E(G) \rightarrow$ $\{1,2,3 \ldots \ldots . . .(p+q)\}$ is said to be a total prime labeling if,

(i) For each edge $e=u v$, the labels assigned to $u$ and $v$ are relatively prime.
(ii) For each vertex of degree at least two, the greatest common divisor of the labels of the incident edges is one.

In this paper we investigated the total prime labeling of the one side triangular graph ( $t_{n}$ ), graph ( $\mathrm{C}_{\mathrm{n}} . \mathrm{P}_{\mathrm{m}}$ ), $\operatorname{graph}\left(C_{n}(m)\right.$ ), graph $m$ copies of $C_{n}$ and comb related graphs.

Keywords: Labeling, prime labeling, total prime labeling.

## Introduction:

Here, we consider only the graphs which are finite, simple and undirected graphs. A graph $\quad \mathrm{G}=(\mathrm{V}(\mathrm{G}), \mathrm{E}$ $(\mathrm{G})$ ) where $\mathrm{V}(\mathrm{G})$ denotes the vertex set and $\mathrm{E}(\mathrm{G})$ denotes the edge set. The order and size of the graph G are denoted by ' $p$ ' and ' $q$ ' respectively. For all other terminology and notations in graph theory, we follow Harary [1]. The notion of prime labeling was introduced by Rojer Entringer and was discussed in a paper by Tout [2] and vertex prime labeling was discussed in a paper by Deretesky [3].

Graph labeling where the vertices and edges are assigned real values with satisfying some conditions. Prime labeling and vertex prime labeling are already introduced. Combining these two results a new labeling called a total prime labeling was defined by Kala and Ramasubramanian [4] and they proved that the graphs Cycle, Path, Star, Bistar, Comb, Helm are total prime labeling graphs. Two integers are said to be relatively prime means the greatest common divisor is one. By the reference we proved that the graphs wheel, gear, carona, triangular book, double comb and planter graphs are total prime graphs[5].

Now we investigated the one-side triangular graph, graph $m$ copies of $C_{n}$, graph $C_{n} . P_{m}$, graph $C_{n}(m)$, subdivision of pendent edges of comb and double comb are all total prime graphs.

## Definition 1.1:

Let $G=(V, E)$ be a graph with ' $p$ ' vertices, $A$ bijection $f: V(G) \rightarrow\{1,2,3, \ldots \ldots . . p\}$ is said to be as prime labeling if for each edge $e=u v$ the labels assigned to $U$ and $V$ are relatively prime. A graph which admits prime labeling is called prime graph.

## Definition 1.2:

Let $G=(V, E)$ be a graph with ' $p$ ' vertices and ' $q$ ' edges. A bijection $f: E(G) \rightarrow\{1,2, \ldots \ldots . q\}$ is said to be vertex prime labeling if for each vertex of degree at least two the greatest common divisor of the labels on its incident edges is one.

## Definition 1.3:

Let $G=(V, E)$ be a graph with ' $p$ ' vertices and ' $q$ ' edges. A bijection $f$ : VUE $\rightarrow\{1,2,3, \ldots . .(p+q)\}$ is said to be total prime labeling if,
(i) for each edge $e=u v$, the labels assigned to $U$ and $V$ are relatively prime.
(ii) for each vertex of degree at least two, the gcd of the labels on the incident edge is one.

A graph which admits total prime labeling is called total prime graph.

## Definition 1.4:

A subdivision graph $S(G)$ of a graph $G$ is a graph that can be obtained from $G$ by subdividing each edge of $G$ exactly once.

## Definition 1.5:

The path $P_{n}$ has $n$ vertices and $n-1$ edges.

Definition 1.6:

A graph obtained by attaching a single pendent edges to each vertex of a path $P_{n}=v_{1} v_{2} v_{3} \ldots \ldots . . v_{n}$ is called a comb. Main Results:

Theorem 2. 1: The one side triangular graph $t_{n}$ is total prime graph ( n is even).

## Proof:

$$
\text { Let } \quad \begin{aligned}
& V\left(t_{n}\right)=\left\{v_{1}, v_{2}, \ldots \ldots \ldots v_{n}, v_{n+1}, \ldots \ldots v_{2 n}, v_{2 n+1}\right\} \\
& \quad
\end{aligned} \quad\left(t_{n}\right)=\left\{v_{i} v_{i+1} / 1 \leq i \leq 2 n\right\} u\left\{v_{2 i-1} v_{2 i+1} / 1 \leq i \leq n\right\}
$$

Here total number of vertices $p$ is $2 n+1$ and the total number of edges $q$ is $3 n$. Hence $p+q=5 n+1$.

Define a labeling $\mathrm{f}:$ VUE $\rightarrow\{1,2,3, \ldots \ldots \ldots . .(5 n+1\}$ is defined by

$$
\begin{aligned}
& f\left(v_{i}\right)=1 ; 1 \leq i \leq 2 n+1 \\
& f\left(e_{i}\right)=2 n+1+1 ; 1 \leq i \leq 3 n
\end{aligned}
$$

According to this pattern,
(i) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}+1} / 1 \leq \mathrm{i} \leq 2 \mathrm{n}\right\}=\operatorname{gcd}\{\mathrm{i}, \mathrm{i}+1\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}$
(ii) $\operatorname{gcd}\left\{v_{2 i-1}, v_{2 i+1}\right\}=\operatorname{gcd}\{2 i-1,2 i+1\}=1$ for $1 \leq i \leq n$
(iii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{1}\right\}=\operatorname{gcd}\{2 n+2,2 n+3\}=1$
(iv) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 n+1}\right\}=\operatorname{gcd}\{5 n-1,5 n\}=1$
(v) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 i}\right\}=\operatorname{gcd}\{2 n+3 i, 2 n+3 i+1\}=1$ for $1 \leq i \leq n$
(vi) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 i+1}\right\}=\operatorname{gcd}\{2 n+3 i-1,2 n+3 i+1,2 n+3 i+2,2 n+3 i+3\}$ $=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}-1$.

Thus for each edge $e=u v$, where $u$ and $v$ are relatively prime and the gcd of each vertices of degree at least two, all the incident edges is one. Therefore, the graph $\left(\mathrm{t}_{\mathrm{n}}\right)$ is a total prime graph.

## Example:

Total prime graph of one side triangular graph $\mathrm{t}_{4}$ ( n even).
(

Theorem 2.2: The one side triangular graph $t_{n}$ is total prime graph ( $n$ is odd).

## Proof:

Let

$$
\begin{aligned}
& \mathrm{V}(\mathrm{G}) \quad=\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots \ldots . . . v_{n}, v_{n+1}, \ldots \ldots . v_{2 n}, v_{2 n+1}\right\} \text { and } \\
& \mathrm{E}(\mathrm{G}) \quad=\left\{\mathrm{v}_{\mathrm{i}} \mathrm{v}_{\mathrm{i}+1} / 1 \leq \mathrm{i} \leq 2 \mathrm{n}\right\} \mathrm{u}\left\{\mathrm{v}_{2 i-1} \mathrm{v}_{2 i+1} / 1 \leq \mathrm{i} \leq n\right\}
\end{aligned}
$$

Here total number of vertices $p$ is $2 n+1$ and the total number of edges $q$ is $3 n$. Hence $p+q=5 n+1$.

Define a labeling

$$
\begin{aligned}
& \mathrm{f}: \text { VUE } \rightarrow\{1,2,3, \ldots \ldots \ldots . .(5 n+1)\} \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=\mathrm{i} ; 1 \leq \mathrm{i} \leq 2 \mathrm{n}+1 \\
& \mathrm{f}\left(\mathrm{e}_{\mathrm{i}}\right)=2 \mathrm{n}+1+\mathrm{i} ; 1 \leq \mathrm{i} \leq 3 n-2 \\
& \mathrm{f}\left(\mathrm{e}_{\mathrm{i}}\right)=2 \mathrm{n}+2+\mathrm{i} ; \mathrm{i}=3 n-1 \\
& \mathrm{f}\left(\mathrm{e}_{\mathrm{i}}\right)=2 \mathrm{n}+\mathrm{i} ; \mathrm{i}=3 n
\end{aligned}
$$

According to this pattern,
(i) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}+1}\right\}=\operatorname{gcd}\{\mathrm{i}, \mathrm{i}+1\}=1$ for $1 \leq \mathrm{i} \leq 2 \mathrm{n}$
(ii) $\operatorname{gcd}\left\{v_{2 i-1}, v_{2 i+1}\right\}=\operatorname{gcd}\{2 i-1,2 i+1\}=1$ for $1 \leq i \leq n$
(iii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{1}\right\}=\operatorname{gcd}\{2 n+2,2 n+3\}=1$
(iv) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 n}\right\}=\operatorname{gcd}\{5 n-1,5 n\}=1$
(v) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 i}\right\}=\operatorname{gcd}\{2 n+3 i, 2 n+3 i+1\}=1$ for $1 \leq i \leq n-1$
(vi) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 n+1}\right\}=\operatorname{gcd}\{5 n-1,5 n\}=1$
(vii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 i+1}\right\}=\operatorname{gcd}\{2 n+3 i-1,2 n+3 i+1,2 n+3 i+2,2 n+3 i+3\} \quad=1$ for 1 $\leq \mathrm{i} \leq \mathrm{n}-2$
(viii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{2 n-1}\right\}=\operatorname{gcd}\{5 n-4,5 n-2,5 n-1,5 n+1\}=1$.

Thus for each edge $e=u v$, where $u$ and $v$ are relatively prime and the gcd of each vertices of degree at least two, all the incident edges is one. Therefore, the triangular graph $\left(t_{n}\right)$, ( $n$ is odd) is a total prime graph.

## Example:

Total prime graph of one side triangular graph $\mathrm{t}_{4}$ ( n odd).

Theorem 2.3: The graph $m$ copies of $C_{n}$ is a total prime graph (for all $m, n$ )

## Proof:

Let $C_{n}$ is a cycle with $n$ vertices and $n$ edges. Here $G$ is $m$ copies of $C_{n}$ where $C_{n}$ are joined by a single path.

$$
\begin{aligned}
& \text { Let } v(G)=\left\{v_{11}, v_{12}, \ldots \ldots \ldots . v_{1 n}, v_{21}, v_{22,}, \ldots \ldots \ldots . v_{2 n 1}, \ldots \ldots \ldots . v_{m 1}, v_{m 2}, \ldots \ldots \ldots . v_{m n}\right\} \text { and } \\
& \qquad E(G)=\left\{v_{i j} v_{i j+1} / 1 \leq i \leq m, 1 \leq i \leq n\right\} \cup\left\{v_{i n} v_{i 1} / 1 \leq i \leq m\right\} \cup\left\{v_{i 1} v_{(i+1) 1} / 1 \leq i \leq m-1\right\} .
\end{aligned}
$$

Hence, the total number of vertices $p$ is $m n$ and the total number of edges $q$ is $n m+m-1$. Hence $p+q=$ $2 m n+m-1$.

Define a labeling $\mathrm{f}: \mathrm{VUE} \rightarrow\{1,2, \ldots . . .(2 m n+m-1)\}$ as follows

$$
\begin{aligned}
& f\left(v_{i j}\right)=n(i-1)+j ; 1 \leq i \leq m, 1 \leq i \leq n \\
& f\left(e_{i j}\right)=m n+(i-1) n+i+(j-1) ; \quad 1 \leq i \leq m, 1 \leq i \leq n .
\end{aligned}
$$

According to this pattern,
(i) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{ij}}, \mathrm{v}_{\mathrm{ij}+1}\right\}=\operatorname{gcd}\{\mathrm{n}(\mathrm{i}-1)+1\},\{\mathrm{n}(\mathrm{i}-1)+\mathrm{j}+1\}=1$ for $1 \leq \mathrm{i} \leq m, 1 \leq \mathrm{j} \leq \mathrm{n}-1$
(ii) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}+1}\right\}=\operatorname{gcd}\{\mathrm{n}(\mathrm{i}-1)+\mathrm{j}, \mathrm{n}(\mathrm{i}-1)+\mathrm{j}+1\}=1$ for $1 \leq \mathrm{j} \leq \mathrm{n}-1$
(iii) $\operatorname{gcd}\left\{v_{i n}, v_{i j}\right\}=\operatorname{gcd}\{n(i-1)+j, n(i-1)+j+1\}=1$ for $1 \leq i \leq m$
(iv) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{i j}\right\}=\operatorname{gcd}\{m n+(i-1) n+i+j+1, m n+(i-1) n+i+j+1\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{m}, 1 \leq \mathrm{i} \leq \mathrm{n}-1$
(v) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{i i}\right\}=\operatorname{gcd}\left\{\mathrm{e}_{11}, \mathrm{e}_{1 \mathrm{n}}, \mathrm{e}_{1 \mathrm{n}+1}\right\}=\{m n+1, m n+\mathrm{n}, \quad m n+n+1\}=$ 1
(vi) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{m 1}\right\}=\operatorname{gcd}\left\{e(m-1)(n+1), e_{m 1}, e_{m n}\right\}=\operatorname{gcd}\{m n+n(m-1)+n+m+1, m n$ $+(m-1)+1, m n+n(m-1)+m+n+1, m n+(m-1)+1, m n+n(m-1)+m+n-1\}=1$

Thus for each edge $\mathrm{e}=\mathrm{u} \mathrm{v}$, where u and v are relatively prime and the gcd of each vertices of degree at least two, all the incident edges is one. Therefore, the graph m copy of C n is a total prime graph.

## Example:

Total prime graph of three copies of $\mathrm{c}_{4}$.

Theorem 2.4: The graph obtained by subdivision of pendent edges of a comb $P_{n} . K_{1}$ is a total prime labeling graphs.

## Proof:

Let $P_{n} . K_{1}$ be a comb obtained from the path $P_{n}=v_{1} v_{2} \ldots \ldots . v_{n}$ and by joining a vertex $u_{i}$ to $v_{i}$, $1 \leq i \leq n$, where $u_{i}$ are the pendent vertices adjacent to $\mathrm{v}_{\mathrm{i}}$.

Let

$$
\begin{aligned}
& V\left(P_{n} . K_{1}\right)=\left\{v_{1}, v_{2}, \ldots \ldots \ldots \ldots \ldots . . v_{n}, u_{1}, u_{2}, \ldots \ldots \ldots \ldots . . . u_{n}\right\} \\
& E\left(P_{n} . K_{1}\right)=\left\{v_{i} u_{i} / 1 \leq i \leq n\right\} u\left\{v_{i} v_{i+1} / 1 \leq i \leq n-1\right\}
\end{aligned}
$$

Now the pendent edges are subdivided by two edges. The subdivision of pendent edges of a comb $\mathrm{Pn} . \mathrm{K}_{1}$ is derived and $S\left(P_{n} . K_{1}\right)$. The new vertices are $u_{1}{ }^{\prime}, u_{2}{ }^{\prime}, \ldots . . u_{n}{ }^{\prime}$.

Let

$$
\begin{aligned}
& \mathrm{V}\left[\mathrm{~S}\left(\mathrm{P}_{\mathrm{n}} . \mathrm{K}_{1}\right)\right]=\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots \ldots \ldots . \mathrm{v}_{\mathrm{n}}, \mathrm{u}_{1}, \mathrm{u}_{2}, \ldots \ldots \mathrm{u}_{\mathrm{n}}, \mathrm{u}_{\left.1^{\prime}, \mathrm{u}_{2}^{\prime} \ldots \ldots \ldots \mathrm{u}_{\mathrm{n}}^{\prime}\right\}}\right. \\
& \mathrm{E}\left[\mathrm{~S}\left(\mathrm{P}_{\mathrm{n}} . \mathrm{K}_{1}\right)\right]=\left\{\mathrm{v}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}} / 1 \leq \mathrm{i} \leq \mathrm{n}\right\} \mathrm{u}\left\{\mathrm{u}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}^{\prime}} / 1 \leq \mathrm{i} \leq \mathrm{n}\right\} \mathrm{u}^{\prime}\left\{\mathrm{v}_{\mathrm{i}} \mathrm{v}_{\mathrm{i}+1} / 1 \leq \mathrm{i} \leq \mathrm{n}-1\right\} \text { and }
\end{aligned}
$$

The total number of vertices $p=3 n$. The total number of edges $q=3 n-1$. Hence $p+q=6 n-1$.
Define a bijection

$$
\begin{aligned}
& \mathrm{f}: \text { VUE } \rightarrow\{1,2,3, \ldots \ldots . .(6 n-1)\} \text { by } \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=3 \mathrm{i}-2 ; 1 \leq \mathrm{i} \leq \mathrm{n} \\
& \mathrm{f}\left(\mathrm{u}_{\mathrm{I}^{\prime}}\right)=3 \mathrm{i}-1 ; 1 \leq \mathrm{i} \leq \mathrm{n} \\
& \mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)=3 \mathrm{i} ; 1 \leq \mathrm{i} \leq \mathrm{n} \\
& \mathrm{f}\left(\mathrm{e}_{\mathrm{i}}\right)=3 \mathrm{n}+\mathrm{I} ; 1 \leq \mathrm{i} \leq 3 n-1 .
\end{aligned}
$$

According to this pattern
(i) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{i}}, \mathrm{u}_{\mathrm{i}}{ }^{\prime}\right\}=\operatorname{gcd}\{3 \mathrm{i}-2,3 \mathrm{i}-1\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}$
(ii) $\operatorname{gcd}\left\{\mathrm{u}_{\mathrm{i}}{ }^{\prime}, \mathrm{u}_{\mathrm{i}}\right\}=\operatorname{gcd}\{3 \mathrm{i}-1,3 \mathrm{i}\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}$
(iii) $\operatorname{gcd}\left\{\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}+1}\right\}=\operatorname{gcd}\{3 \mathrm{i}-2,3 \mathrm{i}+1\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}-1$
(iv) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.u_{i}^{\prime}\right\}=\operatorname{gcd}\{3 n+3 i-2,3 n+3 i-1\}=1$ for $1 \leq i \leq n$.
(v) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{1}\right\}=\operatorname{gcd}\{3 n+2,3 n+3\}=1$.
(vi) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{n}\right\}=\operatorname{gcd}\{6 n-3,6 n-1\}=1$.
(vii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{i}\right\}=\operatorname{gcd}\{2 n+3 i, 3 n+3 i\}=1$ for $2 \leq i \leq n-1$.

Thus for each edge $e=u v$, where $u$ and $v$ are relatively prime and the gcd of each vertices of degree at least two, all the incident edges is one. Therefore, the graph obtained by subdivision of the edges $S\left(P_{n} \cdot K_{1}\right)$ is a total prime graph.

Example:
Total prime graph of $\mathrm{S}\left(\mathrm{P}_{3} . \mathrm{K}_{1}\right)$

Theorem 2.5: The graph obtained by subdivision of pendent edges of a double comb $P_{n} . K_{1,2}$ is total prime graph.

## Proof:

The double comb is obtained from the path joining a double side pendent edges.

$$
\text { Let } \begin{aligned}
V(G) & =\left\{v_{1}, v_{2}, \ldots . v_{n}, w_{1}, w_{2}, \ldots \ldots . . w_{n}, \ldots \ldots . . u_{1}, u_{2}, \ldots \ldots \ldots . u_{n}\right\} \text { and } \\
E(G) & =\left\{v_{i} w_{i} / 1 \leq i \leq n\right\} \cup\left\{v_{i} u_{i} / 1 \leq i \leq n\right\} \cup\left\{v_{i} v_{i+1} / 1 \leq i \leq n-1\right\}
\end{aligned}
$$

Now, subdividing the pendent edges of both sides of the comb by a single vertex, is denoted by $\mathrm{S}\left(\mathrm{P}_{\mathrm{n}} . \mathrm{K}_{1,2}\right)$
Let $V\left[S\left(P_{n} \cdot k_{1,2}\right)\right]=\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots . . \mathrm{v}_{\mathrm{n}}, \mathrm{w}_{1}, \ldots . \mathrm{w}_{\mathrm{n}}, \mathrm{u}_{1}, \mathrm{u}_{2}, \ldots . . . \mathrm{u}_{\mathrm{n}}, \mathrm{w}_{1}{ }^{\prime}, \mathrm{w}^{2}{ }^{\prime}, \ldots . . \mathrm{w}_{\mathrm{n}}{ }^{\prime}, \mathrm{u}_{1}{ }^{\prime}, \mathrm{u}_{2}{ }^{\prime}, \ldots \ldots . . \mathrm{u}_{\mathrm{n}}{ }^{\prime}\right\}$
$E\left[S\left(P_{n} \cdot k_{1,2}\right)\right]=\left\{v_{i} w_{i}^{\prime} / 1 \leq i \leq n\right\} \cup\left\{w_{i}^{\prime} w_{i} / 1 \leq i \leq n\right\} \cup\left\{v_{i} u_{i}^{\prime} / 1 \leq i \leq n\right\} U\left\{u_{i}^{\prime} u_{i} / 1 \leq I \leq n\right\} \quad U\{$ $\left.v_{i} v_{i+1} / 1 \leq i \leq n\right\}$.

The total number of vertices are $p=5 n$ and the total number of edges are $q=5 n-1$. Hence $p+q=10 n-1$.
Define a labeling

F: VUE $\rightarrow\{1,2, \ldots \ldots . .(10 n-1)\}$ by
$\mathrm{f}:\left(\mathrm{v}_{\mathrm{i}}\right)=5 \mathrm{i}-2 ; 1 \leq \mathrm{i} \leq n$
f: $\left(u_{i}\right)=5 i-4 ; 1 \leq i \leq n$
f: $\left(u_{i}{ }^{\prime}\right)=5 i-3 ; 1 \leq i \leq n$
f: $\left(w_{i}^{\prime}\right)=5 i-1 ; 1 \leq i \leq n$
$\mathrm{f}:\left(\mathrm{w}_{\mathrm{i}}\right)=5 \mathrm{i} ; 1 \leq \mathrm{i} \leq \mathrm{n}$
$f:\left(e_{i}\right)=5 n+i ; i \leq I \leq 5 n-1$
According to this pattern,
i) $\operatorname{gcd}\left\{u_{i}, u_{i}^{\prime}\right\}=\operatorname{gcd}\{5 i-4,5 i-3\}=1$ for $1 \leq i \leq n$
ii) $\operatorname{gcd}\left\{\mathrm{u}_{\mathrm{i}}{ }^{\prime}, \mathrm{v}_{\mathrm{i}}\right\}=\operatorname{gcd}\{5 \mathrm{i}-3,5 \mathrm{i}-2\}=1$ for $1 \leq \mathrm{i} \leq \mathrm{n}$
iii) $\operatorname{gcd}\left\{v_{i}, w_{i}^{\prime}\right\}=\operatorname{gcd}\{5 i-4,5 i-1\}=1$ for $1 \leq i \leq n$
iv) $\operatorname{gcd}\left\{w_{i}^{\prime}, w_{i}\right\}=\operatorname{gcd}\{5 i-1,5 i\}=1$ for $1 \leq i \leq n$
v) $\operatorname{gcd}\left\{v_{i}, v_{i+1}\right\}=\operatorname{gcd}\{5 i-2,5 i+3\}=1$ for $1 \leq i \leq n-1$
vi) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.w_{i}^{\prime}\right\}=\operatorname{gcd}\{5 n+5 i-2,5 n+5 i-1\}=1$ for $1 \leq i \leq n$
vii) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.u_{i}^{\prime}\right\}=\operatorname{gcd}\{4 n+5 i-4,4 n+5 i-3\}=1$ for $1 \leq i \leq n$
viii) $\operatorname{gcd}\left\{\right.$ all the edges incident with with $\left.v_{1}\right\}=\operatorname{gcd}\{4 n+2,4 n+3,4 n+5\}=1$
ix) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{n}\right\}=\operatorname{gcd}\{9 n+1,10 n-3,10 n-2\}=1$
x) $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{i+1}\right\}=\operatorname{gcd}\{6 n+5 i-4,6 n+5 i-2,6 n+5 i-1,6 n+5 i+1\}=1$ for $1 \leq i \leq n-$ 1

Thus for each edge e =uv, Where $u$ and $v$ are relatively prime and the gcd of each vertex of degree at least two all the incident edges is one. Therefore the graph obtained by subdivision of the edges of $S\left(P_{n} . K_{1,2}\right)$ is a total prime graph.

Example: Total prime graph of $S\left(P_{n} . K_{1,2}\right)$

| $\mathrm{w}_{\mathrm{i}}{ }^{5}$ | 10 | 115 | $0^{20}$ |
| :---: | :---: | :---: | :---: |
| 24 | 29 | 34 | 39 |
| $w_{i} 4^{4}$ | 9 | 14 | 19 |
| 23 | 28 | 33 | 38 |
| vi 25 | 30 | 35 | 8 |
| 3 | 8 | 13 |  |
| 22 | 27 | 32 | 37 |
| $u_{i}{ }^{2} 2$ | 7 | 12 | 17 |
| 21 | 26 | 31 | 36 |
| $u_{i}{ }_{1}$ | 6 | 11 | 16 |

Theorem 2.6: The graph $C_{n} . P_{m}$ is a total prime graph( for all $m, n$ )

## Proof:

The graph $C_{n} . P_{m}$ contains $n$ cycles with $P_{m}$ paths such that the $m$ paths are joined at each vertex of $n$ cycles.

Let $V\left(C_{n} . P_{m}\right)=\left\{V_{11} V_{12} \ldots . . V_{1 n}, V_{21} \ldots V_{n m}\right\}$
$E\left(C_{n} . P_{m}\right)=\left\{V_{i j} V_{i j+1}: 1 \leq i \leq n, 1 \leq j \leq m-1\right\} \cup\left\{V_{i 1} / 1 \leq i \leq n\right\}$

The total number of vertices $p=n m$ and the total number of edges $q=n m$.
Hence $p+q-=2 n m$
Define by a bijetion
$\mathrm{f}:$ VUE $\longrightarrow\{1,2,3, \ldots .2 \mathrm{mn}\}$ by
$\mathrm{f}\left(\mathrm{v}_{\mathrm{ij}}\right)=\mathrm{m}(\mathrm{i}-1)+\mathrm{j} ; 1 \leq \mathrm{i} \leq \mathrm{n}, \quad 1 \leq \mathrm{j} \leq m$
$\mathrm{f}\left(\mathrm{e}_{\mathrm{ij}}\right)=\mathrm{mn}+\mathrm{m}(\mathrm{i}-1)+\mathrm{j} ; 1 \leq \mathrm{i} \leq \mathrm{n}, \quad 1 \leq \mathrm{j} \leq \mathrm{m}$
According to this pattern
i. $\left.\operatorname{gcd}\left\{v_{i j}, v_{i j+1}\right\}=\operatorname{gcd}\{m i-1)+j, m(i-1)+j+1\right\}=1$ for $1 \leq i \leq n, 1 \leq i \leq m$
ii. $\operatorname{gcd}\left\{v_{i 1}, v_{(i+1) 1}\right\}=\operatorname{gcd}\{m(i-1)+1, m i\}=1$ for $1 \leq i \leq n-1,1 \leq j \leq m$.
iii. gcd $\left\{\right.$ all the edges incident with $\left.v_{i j}\right\}=\operatorname{gcd}\{m n+m(i-1)+j, m n+m(i-1)+j+1\}=1 \quad$ for $1 \leq i$
$\leq n, \quad 1 \leq j \leq m-1$.
iv. $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{11}\right\}=\operatorname{gcd}\{m n+m-1, m n+m, 2 m n\}=1$ for $i=1$.
v. $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{n 1}\right\}=\operatorname{gcd}\{m n+m(n-2)+1, m n+m(n-1), m n+m \quad(n-1)+1\}=1$.
vi. $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{(i+1) 1}\right\}=\operatorname{gcd}\{n m+m(i-1)+m, m n+m i+m-1, n m+m i+m\}=1$ for $1 \leq i \leq$ ( $n-1$ ).

Thus for each edge $e=u v$, where $u$ and $v$ are relatively prime and the gcd of each vertex of degree at least two all the incident edges is one. Therefore, the graph $C_{n} . P_{m}$ is a total prime graph.

## Example:

Total prime graph $\mathrm{C}_{4} . \mathrm{P}_{3}$

Theorem 2.7: The graph $C_{n}(m)$ is total prime graph (for all $m, n$ )

## Proof:

The graph $C_{n}(m)$ is a graph which contains $C_{n}$ cycles with $m$ times such that the nth vertex all $n$ cycles are joined by a single vertex ( $u$ )
Let $\left.\quad V(G)=\left\{v_{11}, v_{12} \ldots . v_{1(n-1)}, v_{21}, v_{22}, \ldots . \ldots . . . v_{2(n-1}\right) v_{m 1} \ldots . v_{m(n-1)}, u\right\}$

$$
E(G)=\left\{v_{i j} v_{i j+1} / 1 \leq i \leq m, 1 \leq j \leq n-2\right\} \cup\left\{u v_{i 1} / 1 \leq i \leq m\right\} \cup\left\{v_{i(n-1)} u / 1 \leq i \leq m\right\}
$$

Here, the total number of vertices $P$ is $m(n-1)$ and the total number of edges $q$ is $m n$.
Hence $p+q=2 m n-m+1$.
Define a bijection, $\mathrm{f}:$ VUE $\longrightarrow\{1,2, \ldots .(2 m n-m+1)\}$ by

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{v}_{\mathrm{ij}}\right)=(\mathrm{n}-1)(\mathrm{i}-1)+\mathrm{j}+1 ; 1 \leq \mathrm{i} \leq m \quad 1 \leq \mathrm{j} \leq \mathrm{n}-1 \\
& \mathrm{f}\left(\mathrm{e}_{\mathrm{ij}}\right)=\mathrm{m}(\mathrm{n}-1)+\mathrm{n}(\mathrm{i}-1)+\mathrm{j}+1 ; 1 \leq \mathrm{i} \leq m \quad 1 \leq \mathrm{j} \leq \mathrm{n}-1
\end{aligned}
$$

According to the pattern
i. $\operatorname{gcd}\left\{u, v_{i 1}\right\}=\operatorname{gcd}\{1,(n-1)+(i-1)+j+1\}=1$ for $1 \leq i \leq m$
ii. $\operatorname{gcd}\left\{v_{i(n-1)}, u\right\}=\operatorname{gcd}\{(n-1)(i-1)+j+1,1\}=1$ for $1 \leq i \leq m$
iii. $\operatorname{gcd}\left\{v_{i j}, v_{i j+1}\right\}=\operatorname{gcd}\{(n-1)(i-1)+j+1,(n-1)(i-1)+j+2\}=1$ for $1 \leq i \leq m, \quad 1 \leq j \leq n-$ 2
iv. $\operatorname{gcd}\left\{\right.$ all the edges incident with $\left.v_{i j}\right\}=\operatorname{gcd}\{m(n-1)+n(i-1)+J+1, m(n-1)+n(i-1)+j+2\}$
$=1$ for $1 \leq \mathrm{i} \leq m, \quad 1 \leq \mathrm{j} \leq \mathrm{n}-1$
v. $\operatorname{gcd}\{$ all the edges incident with $u\}=\operatorname{gcd}\{m(n-1)+n(i-1)+J+1\}=1$ for $1 \leq i \leq m, \quad j=1$ and $j=$ n.

Thus for each edge $e=u v$ where $u$ and $v$ are relatively prime and for each vertex of degree at least two the gcd of all the incident edges is one. Therefore the graph $C_{n}(m)$ is a total prime graph.

## Example:

Total prime graph of $\mathrm{C}_{4}(3)$
