Use of Aromatic Plant *Leucas aspera* in Cosmetic Industry

Dr. Mrs. Sharada K. Ulhe - Deshmukh

Department Of Botany, Mahatma Fule Arts, Commerce & Sitaramji Choudhari Science College, Warud, Dist-Amravati.

Abstract –

The current piece of work is a focus on micro level study and is purely based on contents in leaf of *L. aspera* in Nagpur region which is use in medicine as well as cosmetics. Basically Aromatic plants of family Lamiaceae that is *L. aspera* have aromatic smell and its aroma which is a characteristic features of family Lamiaceae. *L. aspera,* is commonly known as Dronapushpi. In this work I got six compounds in leaves of *L.aspera* which is use as medicine as well as cosmetics industry. These are 9,9 trimethyloctahydrbenzo(d) cycloprop(c) oxepin-2,4-dione,3-Buten-2-one,3-methyl-4-(1,3,3-trimethyl-7-Oxabicyclo[4.1.0]heptan-1y, Tetratriacontane ,Hexacosane, Heptacosane, Tetratetracontane. Also I got 1.33 % gm of aroma oil found in 100 gm leaves of *L. aspera. L. aspera* is a wild herb or shrub which is having medicinal value to a great extent and is available abundantly in field of India Conclusion- Natural herbs help in preserving and enhancing the beauty and personality of human beings. Natural Cosmetics and personal-care products may contain ingredients whose safety is unknown or which are known to create health risks. The present review focuses on the potential of herbal extracts for cosmetic purposes. Natural cosmetics general term applied to all preparation and external conditioning and beautifying the body.

Key words:-Leucas aspera, cosmetics, aromatic, medicine.

Fig. *Leucas aspera*
Introduction:

According to world health organization (WHO) variety of drugs are obtained from ethnomedicinal plants. In developed countries almost 80% of individuals depends on compounds derived from ethnomedicinal plant. In this regard properties, saftety & efficiency of them should be investigated. Ethnobotany is systematic study of the relationship between plants and people. It is not simply the study of human use of plants rather ethnobotany locates plants within their cultural contex in particular societies. The impacts of modern human societies on traditional cultures and natural habitats have caused huge losses of individual species and profoundly disrupted communites of species. The singnificance of ethnobotany and ethnomedicinal plant is mainfold. The study of indigenous food production and local medicinal knowledge may have practical implication for developing sastainble agriculture and discovery of new medicines. Ethnobotany also encourage an awarness of the link between biodiversity and culture diversity as well as a sophisticated understanding of the mutual influence of plants mutual influence of plants and human. The Global strategy for Plant conservation, a plant to save the world’s Plant species-grew out of the Convention on Biological diversity and is being fed into government policy around the world. The GSPC highlights the importance of plants and the ecosytem services they provide for all life on earth, and aims to ensure their conservation. The Global strategy for Plant consevation is a catalyst for working together at all levels-local national, regional and global-to understand, conserve and use sustainably the worlds’s immense wealth of plant diversity whilst promoting awareness and building the necessary capcities for its implention. Ethnomedicinal plant consevation strategies need to be understood and planned for based on an understanding of indigenous knowledge and practices. Gas chromatogrphy and Mass spectrum is one of the best method to identify the plants chemical components. *Leucas aspera* contain essential oil which is volatile organic strong smell substance and have great importance in pharmaceuticals industries, food, cosmetics etc.

History And Description of *Leucas aspera* (L) Poit.

Lamiaceae family species are important for its medicinal properties among plants. This family represented by 45 genera and 574 species. Number of aromatic plants come under this family. *Leucas aspera* (wild) belonging to the family of Lamiaceae is a aromatic herb commonly called “Tamba”, found as weed in Africa, Asia-temperate and Asia – tropical countries. *Leucas aspera* was first described by Linnaeus based on an illustration and description of plants growing in the Leiden botanic garden. *Luucas aspera* (wild) plant contains essential oil which is alkaloids.

Methodology-

The present work is based on various site surveys made in Nagpur region( Maharashtra). The plant was collected and its identification was authenticated at research laboratory of Institute of Science, Nagpur. The information of traditional uses of the plant was gathered from respective site. GC-MS Analysis - The test
plant extracts were subjected to GC-MS analysis at laboratory’s (IIT Bombay) Sophisticated Analytical Instrument Facility (formerly RSIC), Indian Institute of Technology, Powai, Mumbai – 400076, India.

**Result and Discussion:**

The present investigation was carried out on plant *Leucas aspera* of Lamiaceae family to study the presence of medicinally active phytochemicals in the leaves. The chemical composition of the essential compounds from the leaves of *Leucas aspera* (L.) Poit collected from campus and PDKV forest which experienced different climatic and geographic circumstances, were determined by GC-MS. It has been already reported by various workers. As seen in the table- 1, different compounds were determined from the leaves of *Leucas aspera* (L.) Poit. The present investigations concluded that the leaf of *Leucas aspera* contains chemical compounds. These chemicals are widely used in Ayurvedic traditional medicines as well as cosmetics industry..

*Leucas aspera* contain chemical compounds and herbal ingredients, and it has been said that 70-80% of the world’s population relies on some from of non-conventional medicine⁴ and around 25-40% of all prescription drugs contain active ingredients derived from plants in the United States⁵.

**Medicinal importance :**

*Leucas aspera* used to treat inflammatory and allergic conditions.

*The entire plant is also used as an insecticide and indicated in traditional medicine for cough, colds, painful swelling and chronic skin eruption⁶.

*Apart from this, the plant possesses wound healing property and is used in cobra venom poisoning⁶*

*Aromatic oil is found in 1.33% in 3gm of dry weight of powder of leaves of *Leucas aspera*.

Detection of Oil in *Leucas aspera*

Ether is continuously volatilized, condensed and then allowed to pass through the sample to extract ether soluble materials. When the process is completed the ether is distilled, collected in another container, remaining crude fat is dried, weight and percent oil is calculated. I got 1.33% oil in leaves of *Leucas aspera*.

Weight of sample 3 gm dry leaves powder.

Conclusion:

Most of the medicinal claims are centered on flower and inflorescence of the plant. The whole plant and leaves, are also administered in a few specific clinical conditions. The analysis of all the claims clearly indicates the potential of the plant to be an excellent analgesic, antipyretic and anti-inflammatory drug which needs to be validated through preclinical and safety and efficacy trials. The present GC-MS screenings are an essential tools for confirmation of the results and it may serve as pavements for the researcher to select a group of plants having similar chemical constituents and their detailed investigation regarding their chemistry and functions is required, so that they can be used in allopathic or in Ayurvedic medicine as well as cosmetics industry.
