Abstract: These people apparently need the kind of care which most busy family members cannot provide. Some people may forget to take the medicines at the correct time and can forget the medicines which they have to take. So in order to help them with this liability we have developed this project. The people are provided a smart med box on which there will be a display which notifies the people about the medicine. Along with this we can alert them with an alarm and light indications. So that even if the person is sleeping or busy with some work the alarm helps in alerting him. to confirm that the person has taken that medicine or not we can put one button at the opening end of the pill box. so when the person tries to open the box the button is pressed and the alarm will be off only if the buzzer is pressed. by this data we can tell that the person has taken the medicine. It comes with one more feature that when the person is feeling uneasy or in case of some emergency he can notify the people by pressing the button on the device. There are different buttons, one is used to notify the doctor and the other one is used to notify family members about the emergency.

Index Terms – Arduino UNO, Pill box, Buzzer, Push Button, IoT etc.

I. INTRODUCTION

Currently, worldwide aging and regularity of persistent diseases are flatterer a broad concern. Numerous countries are undergoing hospital restructuring by reducing number of hospital beds and escalating home healthcare, which is envisioned to perk up health care quality, has fascinated wide-ranging attention. In order to track the physical status of the elderly and, in the meanwhile, to keep them healthy, the proposed idea will be helpful. IOT expands the Internet into our everyday lives by wirelessly connecting various smart objects, and will bring significant changes in the way we live and interact with smart devices. The new wave in the era of computing will be outside the sphere of the conventional desktop. Internet of Things (IOT) is a network where many of the objects that surround us will be networked in one form or another. By using this technology the health statistics of medication are observed. In this process of encryption the schedule data or doctor's prescription are sent to pill box through mobile app. The LEDs are placed for indication and buzzer for alarm alerts and reset button is used to count for medicine in cloud platform. The existing techniques to the market for the reminder include a pill box. But this does not help in checking the medicine. This proposed idea is valuable solution to the medical noncompliance problem. The innovation scheme to help patient keep trail of their

medicine consumption through a series LED alarm indicator signal and audio alarm indicator signals.

II. INTERNET OF THINGS

The Internet of Things (IOT) is an important topic in technology industry, policy, and engineering circles and has become headline news in both the specialty press and the popular media. This technology is embodied in a wide spectrum of networked products, systems, and sensors, which take advantage of advancements in computing power, electronics miniaturization, and network interconnections to offer new capabilities not previously possible. An abundance of conferences, reports, and news articles discuss and debate the prospective impact of the "IOT revolution"—from new market opportunities and business models to concerns about security, privacy, and technical interoperability.

IOT systems like networked vehicles, intelligent traffic systems, and sensors embedded in roads and bridges move us closer to the idea of "smart cities", which help minimize congestion and energy consumption. IOT technology offers the possibility to transform agriculture, industry, and energy production and distribution by increasing the availability of information along the value chain of production using networked sensors. However, IOT raises many issues and challenges that need to be considered and addressed in order for potential benefits to be realized

III. LITERATURE SURVEY

[1] *A Smart Pill Box with Remind and Consumption Confirmation Functions* Author: *Huai-Kuei Wu, Member, Chi-Ming Wong, Pang-Hsing Liu, Sheng-Po Peng, Xun-Cong Wang.*

Population aging could be a international issue that affects several developing countries like Taiwan. The natural decline in physical operate with aging results in a rise in incidences of assorted chronic diseases in older individuals, most patients with chronic diseases ought to take medications over a chronic amount of your time so as to stabilize their conditions. making certain that the patients consume the proper medication at the acceptable time becomes crucial. This paper proposes a wise pill box equipped with a camera and supported the drugs bag conception. The matrix Universal Product Code written on the drugs luggage is employed to act with the pill box up order to perform pill prompt and ensure functions. The members of the family or patients ought to fill the drugs within the pill box manually, this can be an extra responsibility for members of the family of the older, or maybe the patients.

[2] *IoT Platform Based Intelligent Medicine box* Author: *Ninu P.J.1, Varun Kesav M.N.2 M.Tech Student, Department of ECE, Vidya Academy of Science and Technology, Thrissur.*

Most of the elders have multiple chronic diseases, and that they use medicines to stabilize their health conditions. Pharmacists Association suggested that the family ought to be a lot of involved on medication safety of the elders. Most patients with chronic diseases ought to take medications over a long amount of your time so as to stabilize their health conditions. Confirming that the patients consume the proper medication at the right time becomes crucial. associate IoTbased intelligent home-based health care platform, that absolutely connects sensible sensors connected to the bod for biological watching and intelligent medical packaging for daily medication management. The system will offer timely reminders to patients concerning their medication, and precisely management the kind and quantity of prescribed medicines, therefore avoiding medication misuse and abuse. once a patient consults a doctor, his/her details as well as drugs prescription are uploaded to the online server. From the remote physician's

perspective, it's terribly convenient to form or update a prescription for a selected patient.

IV. PROPOSED SYSTEM

To ensure the people consume medicines as per schedule time table, here we developed a smart pill box. The schedule data/configuration data is send to the pill box through IoT. The smart pill box contains Arduino MCU, LED display, LEDs, buzzer, buttons .

The LED are used to display the commands in pill box by MCU. The Wi-Fi module is configured with IoT. The configuration data is send to the smart pillbox when the configuration is in ON mode. The concerned LED glow with buzzer at schedule time

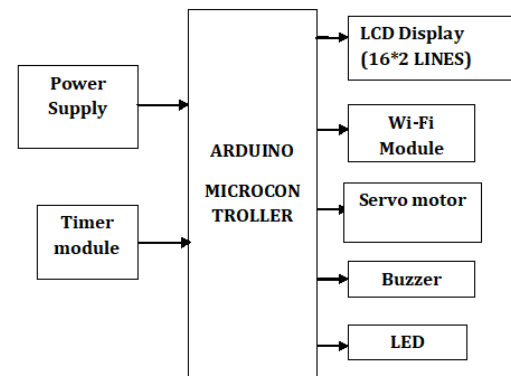

Fig.1 Proposed Block diagram

A. Arduino UNO:

We are using Arduino UNO because it use 8 bit microcontroller ATmega328P and it has 32KB flash memory. These features are beneficial in our project and that's why we used Arduino UNO. Arduino UNO board is connected with all other modules also it controls all other modules & made the interfacing easier. It also has internal EEPROM which stores real time data in it. Our project is based on embedded system we are using Arduino Uno for interfacing all things In that Arduino is an open-source which is easy-to-use hardware and connected software. So Arduino is path between hardware and software. Arduino boards read inputs from a press a button- and turn it into an output, turning on an LED and buzzer, you can tell your board what to do by sending a set of instructions to the microcontroller of Arduino. To do so you use the Arduino programming language , and the Arduino Software (IDE), based on Processing. The programming platform is Arduino IDE and programming language is standard C. we made program for all different module that we are using in our

project. Like RTC module, LCD module 16*2 so firstly we have to add library in Arduino IDE software and after that we made programming.

Fig. 2 Arduino Microcontroller

B. LCD:

We used 16*2 LCD module in our project which is connected to Arduino UNO through a LCD interface IC or directly to its address and data bus and few control pins. LCD shows the current time and date which RTC sends the data to LCD module.

Fig.3 LCD Display

C. RTC module:

We used Tiny RTC I2C module which uses I2C protocol and it is useful in our project. RTC module has internal CMOS cell so it does not need external power supply to update time and date.

Fig.4 RTC Module

D. Buzzer:

Buzzer will ring at proper time when pills have to be taken.

Fig.5 Buzzer

E. Pushbuttons:

We used 3 push buttons from which first one is used for setting medicine, second one is used for increment and third one is used for next. First button takes us to the menu of setting medicine, second button is used to increment the number of hour and minute which we need to set and third button takes us forward from hour to minute and from minute to the next time.

F. Servo Motor:

Servo Motor is used to make easy to open and close the box to take pills.

Fig.6 Servo Motor

V. EXPERIMENTAL RESULTS

We made our project as useful for the patient who needs this and all related users. We conclude result that our project is useful for those people who are taking pills regularly, prescription of medicine is very long and hard to remember for those users. Our product is so useful that it can cure those patients illness and there will no need of

taking care of these types of patients so caregiver has no tension about their health and they will live healthy and tension free life.

Fig.2 Practical prototype model

Fig.3 LCD Showing the Remainder Setting for pills

IV. CONCLUSION

The goal of project is to provide healthy and tension free life to those users who are taking regularly pills and to provide this product at affordable cost also. The project is also reusable by exchanging those other medicine box that has only alerting system and are non-usable or unaffordable compare to our product.

In future After the design is selected, a lock system will be added. The device will be used only by; doctors, keepers, and patients without significant disorders. They would only program the device with a personal password.
