### ABSTRACT:

In this paper, we introduce the concept of  $\tau^*$ -generalized  $\alpha$  continuous multifunctions in topological spaces and study some of their properties where  $\tau^*$  is defined by  $\tau^* = \{G: cl^*(G^c) = G^c\}$

**KEY WORDS:**  $\tau^*$ - $g\alpha$  open set,  $\tau^*$ - $g\alpha$  closed set,  $\tau^*$ - $g\alpha$  continuous

### 1. INTRODUCTION

In 1965, Njastad [9] introduced a weak form of open sets called  $\alpha$ -sets and Mashhour et al. [8] introduced the concept of  $\alpha$ -continuous mappings in 1983. In 1982, the author Noiri. T [13] defined a function from a topological space into a topological space to be strongly semi-continuous if the inverse image of each open set is an  $\alpha$ -set. In 1986, Neubrunn [10] extended these functions to multifunctions and introduced the notion of upper (lower)  $\alpha$ -continuous multifunctions. Various types of functions play a significant role in the theory of classical point set topology. A great number of papers dealing with such functions have appeared, and many of them have been extended to the setting of multifunctions. A multifunction is a set-valued function.

Multifunction in topological spaces have been extensively studied by general topologists. For any two sets  $X$  and  $Y$ ,  $F: X \rightarrow Y$  is a multifunction, if for each  $x \in X$  and  $F(x)$  is a non empty subset of  $Y$ . For a multifunction  $F: X \rightarrow Y$ , upper and lower inverse subset  $B$  of  $Y$  is denoted by  $F^+(B)$  and  $F^-(B)$  respectively that is  $F^+(B) = \{x \in X: F(x) \subseteq B\}$  and  $F^-(B) = \{x \in X: F(x) \cap B \neq \emptyset\}$ . The graph  $G(F)$  of the multifunctions  $F: X \rightarrow Y$  is strongly closed if for each  $(x, y) \notin G(F)$ , there exist open sets  $U$  and  $V$  containing  $x$  and  $y$  respectively such that  $(U \times cl(V)) \cap G(F) = \emptyset$ . Throughout this paper, the space  $(X, \tau^*)$  and  $(Y, \sigma)$  always mean topological spaces and  $F: X \rightarrow Y$  represents a multivalued function. The concept of multifunctions has advanced in a variety of ways and applications of this theory can be found, specially in functional analysis and fixed point theory.

### 2. Preliminaries:

#### Definition: 2.1[9]

Let  $X$  be a topological space and  $A$  be a subset of  $X$ . The closure of  $A$  and interior of  $A$  are denoted by  $cl A$  and  $int(A)$ , respectively.

A subset  $A$  is said to be  $\alpha$ -open if  $A \subset \text{int}(cl(\text{int}(A)))$ .

**Definition: 2.2[15]**

A subset  $A$  is called an  $\alpha$ -neighbourhood of a point  $x$  in  $X$  if there exists  $U \in \alpha(x)$  such that  $x \in U \subset A$ .

**Lemma: 2.3 [1]**

The following are equivalent for a subset  $A$  of a topological space  $X$ :

- (i)  $A \in \alpha(x)$
- (ii)  $U \subset A \subset \text{int}(cl(U))$  for some open set  $U$ .
- (iii)  $U \subset A \subset scl(U)$  for some open set  $U$ .
- (iv)  $A \subset scl(\text{int}(A))$ .

**Lemma: 2.4 [12]**

The following properties hold for a subset  $A$  of a topological spaces  $X$ :

- (i)  $A$  is  $\alpha$ -closed in  $X$  if and only if  $\text{sint}(cl(A)) \subset A$ ;
- (ii)  $\text{sint}(cl(A)) = cl(\text{int}(cl(A)))$ ;
- (iii)  $\alpha cl(A) = A \cup cl(\text{int}(cl(A)))$ .

**Definition: 2.5 [7]**

A subset  $A$  of a topological space  $X$  is called an  $\alpha$ -generalized closed (briefly  $\alpha g$ -closed) if  $cl_\alpha(A) \subseteq G$  whenever  $A \subseteq G$  and  $G$  is open in  $X$ .

**Definition: 2.6 [2]**

For the subset  $A$  of a topological space  $X$ , the generalized closure operator  $Cl^*$  is defined by the intersection of a  $g$ -closed sets containing  $A$ .

**Definition: 2.7 [2]**

For the subset  $A$  of a topological space  $X$ , the topology  $\tau^*$  is defined by  $\tau^* = \{G : Cl^*(G^c) = G^c\}$ .

**Definition: 2.8**

A subset  $A$  of a topological space  $X$  is called  $\tau^*$ -generalized  $\alpha$  closed set (briefly  $\tau^*$ - $g\alpha$  closed). If  $cl^*[(cl_\alpha(A) \subseteq G]$ . Wherever  $A \subseteq G$  and  $G$  is  $\tau^*$  open. The complement of  $\tau^*$ -generalized  $\alpha$  closed set is called the  $\tau^*$ -generalized  $\alpha$  open set (briefly  $\tau^*$ - $g\alpha$  open).

**Definition: 2.9 [6]**

A function  $f: X \rightarrow Y$  is said to be feebly continuous if for every open set  $V$  of  $Y$ ,  $f^{-1}(v)$  is feebly open in  $X$ .

**Definition: 2.10 [8]**

A function  $f: X \rightarrow Y$  is said to be  $\alpha$ -continuous if for every open set  $V$  of  $Y$ ,  $f^{-1}(v)$  is  $\alpha$ -open in  $X$ .

**Definition: 2.11[4]**

A function  $f: X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is  $\alpha g$ -continuous if the inverse image of a closed set  $Y$  is  $\alpha g$ -closed in  $X$ .

**Definition: 2.12 [3]**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is  $\tau^*$ - $g$  continuous if the inverse image of a  $g$ -closed set in  $Y$  is  $\tau^*$ - $g$  closed in  $X$ .

**Definition: 2.13**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is  $\tau^*$ -generalized  $\alpha$  continuous function (briefly  $\tau^*$ - $g\alpha$  continuous) if the inverse image of a  $g\alpha$ -open set in  $Y$  is  $\tau^*$ - $g$  open in  $X$ .

**Remark: 2.14**

If  $X$  is  $\alpha$ -compact and  $f : X \rightarrow Y$  is an  $\alpha$ -continuous surjective, then  $Y$  is compact. [11]

If  $f, g : X \rightarrow Y$  are  $\alpha$  continuous and  $Y$  is Hausdroff, then the set  $\{x \in X / f(x) = g(x)\}$  is  $\alpha$ -closed in  $X$ . [12]

**3. ON  $\tau^*$ -GENERALIZED  $\alpha$  CONTINUOUS MULTIFUNCTIONS :****Definition: 3.1**

A multifunction  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  is said to be,

- (i) Upper  $\tau^*$ -generalized  $\alpha$  continuous at a point  $x$  of  $X$  if for any open set  $V$  of  $Y$  such that  $F(x) \subset V$ , there exists  $U \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that  $F(U) \subset V$ ;
- (ii) Lower  $\tau^*$ -generalized  $\alpha$  continuous at a point  $x \in X$  if for any open set  $V$  of  $Y$  such that  $F(x) \cap V \neq \emptyset$ , there exists  $U \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that  $F(u) \cap V \neq \emptyset$  for every  $u \in U$ ;
- (iii) Upper (resp. lower)  $\tau^*$ -generalized  $\alpha$  continuous if it is upper (resp. lower)  $\tau^*$ -generalized  $\alpha$  continuous at every point of  $X$ .

**Theorem: 3.2**

The following are equivalent for a multifunction  $F : (X, \tau^*) \rightarrow (Y, \sigma)$

- (i)  $F$  is upper  $\tau^*$ - $g\alpha$  continuous at a point  $x \in X$ ;
- (ii)  $x \in \tau^*$ - $gscl(\text{int } F^+(V))$  for any open set  $V$  of  $Y$  containing  $F(x)$ ;
- (iii) For and  $U \in \tau^*$ - $gsO(X)$  containing  $x$  and any open set  $V$  of  $Y$  containing  $F(x)$ , there exists a nonempty open set  $U_V$  of  $X$  such that  $U_V \subset U$  and  $F(U_V) \subset V$ .

**Proof :**

(i)  $\Rightarrow$  (ii) Let  $V$  be any open set such that  $F(x) \subset V$ . Then there exists  $U \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that  $F(U) \subset V$ ; hence  $x \in U \subset F^+(V)$ . Since  $U$  is  $\tau^*$ - $g\alpha$  open,

By Lemma 2.3 (iv) we have  $x \in U \subset \tau^*$ - $gscl(\text{int}(V)) \subset \tau^*$ - $gscl(\text{int } F^+(V))$ .

(ii)  $\Rightarrow$  (iii) Let  $V$  be any open set of  $Y$  such that  $F(x) \subset V$ . Then  $x \in \tau^*$ - $gscl(\text{int } F^+(V))$ . Let  $U$  be any  $\tau^*$ -generalized semi-open set containing  $x$ . Then  $U \cap \text{int}(F^+(V)) \neq \emptyset$  and  $U \cap \text{int}(F^+(V)) \in \tau^*$ - $gsO(X)$ . Put  $U_V = \text{int}[U \cap \text{int}(F^+(V))]$ , then  $U_V$  is a nonempty open set of  $Y$ ,  $U_V \subset U$  and  $F(U_V) \subset V$ .

(iii)  $\Rightarrow$  (i) Let  $\tau^*$ - $gsO(X, x)$  be the family of all  $\tau^*$ -generalized semi-open sets of  $X$  containing  $x$ . Let  $V$  be any open set of  $Y$  containing  $F(x)$ . For each  $U \in \tau^*$ - $gsO(X, x)$ , there exists a nonempty open set  $U_V$  such that  $U_V \subset U$  and  $F(U_V) \subset V$ . Let  $W = \cup \{U_V / U \in \tau^*$ - $gsO(X, x)\}$ . Then  $W$  is open in  $X$ ,  $x \in \tau^*$ - $gscl(W)$  and  $F(W) \subset V$ . Put  $S = W \cup \{x\}$ , then  $W \subset S \subset \tau^*$ - $gscl(w)$ . Then by lemma 2.3 (iii),  $x \in \tau^*$ - $gs \in \tau^*$ - $g\alpha(X)$  and  $F(S) \subset V$ . Hence  $F$  is upper  $\tau^*$ - $g\alpha$  continuous at  $x$ .

**Theorem: 3.3**

The following are equivalent for a multifunction  $F : (X, \tau^*) \rightarrow (Y, \sigma)$

- (i)  $F$  is upper  $\tau^*$ - $g\alpha$  continuous.
- (ii)  $F^+(V) \in \tau^*$ - $g\alpha(X)$  for any open set  $V$  of  $Y$ .
- (iii)  $F^-(V)$  is  $\tau^*$ - $g\alpha$  closed in  $X$  for any closed set  $V$  of  $Y$ .
- (iv)  $\tau^*$ - $gsint(cl(F^-(B))) \subset F^-(cl(B))$  for any set  $B$  of  $Y$ .
- (v)  $\tau^*$ - $gacl(F^-(B)) \subset F^-(cl(B))$  for any set  $B$  of  $Y$ .

- (vi) For each point  $x$  of  $X$  and each neighbourhood  $V$  of  $F(x)$ ,  $F^+(V)$  is an  $\alpha$ -neighbourhood of  $x$ .
- (vii) For each point  $x \in X$  and each neighbourhood  $V$  of  $F(x)$ , there exists an  $\alpha$ -neighbourhood  $U$  of  $x$  such that  $F(U) \subset V$ .

**Proof:**

(i) $\Rightarrow$ (ii) Let  $V$  be any open set of  $Y$  and let  $x \in F^+(V)$ . By Theorem 3.2,  $x \in \tau^*$ -gscl( $\text{int } F^+(V)$ ). Then  $F^+(V) \subset \tau^*$ -gscl( $\text{int } (F^+(V))$ ). By Lemma 2.3 (i),  $F^+(V) \in \tau^*$ -g $\alpha$ ( $X$ ).

(ii) $\Rightarrow$ (iii) In fact that  $F^+(Y - B) = X - F^-(B)$  for any subset  $B$  of  $Y$ .

(iii) $\Rightarrow$ (iv) Let  $B$  be any subset of  $Y$ . Then  $F^-(cl(B))$  is  $\tau^*$ -g $\alpha$  closed in  $Y$ . By Lemma 2.4 (i), we have  $\tau^*$ -gsint( $cl F^-(B)$ )  $\subset$   $\tau^*$ -gsint( $cl (F^- cl (B))$ )  $\subset$   $F^-(cl (B))$ .

(iv) $\Rightarrow$ (v) Let  $B$  be any subset of  $Y$ . By Lemma 2.4 (iii), we have  $\tau^*$ -g $\alpha$ cl( $F^-(B)$ ) =  $F^-(B) \cup \tau^*$ -gsint( $cl F^-(B)$ )  $\subset$   $F^-(cl(B))$ .

(v) $\Rightarrow$ (iii) Let  $V$  be any closed set of  $Y$ . Then we have  $\tau^*$ -g $\alpha$ cl( $F^-(V)$ )  $\subset$   $F^-(cl(V)) = F^-(V)$ . Hence  $F^-(V)$  is  $\tau^*$ -g $\alpha$  closed in  $X$ .

(ii) $\Rightarrow$ (vi) Let  $x \in X$  and  $V$  be a neighbourhood of  $F(x)$ , there exists a open set  $G$  of  $Y$  such that  $F(x) \subset G \subset V$ . So that  $x \in F^+(G) \subset F^+(V)$ . Since  $F^+(G) \in \tau^*$ -g $\alpha$ ( $X$ ),  $F^+(V)$  is an  $\alpha$ -neighbourhood of  $x$ .

(vi) $\Rightarrow$ (vii) Let  $x \in X$  and  $V$  be a neighbourhood of  $F(x)$ . Put  $U = F^+(V)$ , then  $U$  is an  $\alpha$ -neighbourhood of  $x$  and  $F(U) \subset V$ .

(vii) $\Rightarrow$ (i) Let  $x \in X$  and  $V$  be a any open set of  $Y$  such that  $F(x) \subset V$ . There exists an  $\alpha$ -neighbourhood  $U$  of  $x$  such that  $F(U) \subset V$ . Then  $A \in \tau^*$ -g $\alpha$ ( $X$ ) such that  $x \in A \subset U$ , hence  $F(A) \subset V$ .

**Theorem: 3.4**

The following are equivalent for a multifunction  $F : (X, \tau^*) \rightarrow (Y, \sigma)$

- (i)  $F$  is lower  $\tau^*$ -g $\alpha$  continuous.
- (ii)  $F^-(V) \in \tau^*$ -g $\alpha$ ( $X$ ) for any open set  $V$  of  $Y$ .
- (iii)  $F^+(V)$  is  $\tau^*$ -g $\alpha$  closed in  $X$  for any closed set  $V$  of  $Y$ .
- (iv)  $\tau^*$ -gsint( $cl F^+(B)$ )  $\subset$   $F^+(cl(B))$  for any subset  $B$  of  $Y$ .
- (v)  $\tau^*$ -g $\alpha$ cl( $F^+(B)$ )  $\subset$   $F^+(cl(B))$  for any subset  $B$  of  $Y$ .
- (vi)  $F(\tau^*$ -g $\alpha$ cl( $A$ ))  $\subset$   $cl(F(A))$  for any subset  $A$  of  $X$ .
- (vii)  $F(\tau^*$ -gsint( $cl(A)$ ))  $\subset$   $cl(F(A))$  for any subset  $A$  of  $X$ .
- (viii)  $F(cl(\text{int}(cl(A)))) \subset cl(F(A))$  for any subset  $A$  of  $X$ .

**Proof:**

The proof (i) $\Rightarrow$ (ii), (ii) $\Rightarrow$ (iii), (iii) $\Rightarrow$ (iv), (iv) $\Rightarrow$ (v) are similar to the above theorem.

(v) $\Rightarrow$ (vi) Let  $A$  be any subset of  $X$ . Since  $A \subset F^+(F(A))$ , we have  $\tau^*$ -g $\alpha$ cl( $A$ )  $\subset$   $\tau^*$ -g $\alpha$ cl( $F^+(F(A))$ )  $\subset$  ( $F^+(cl(F(A)))$ ) and  $F(\tau^*$ -g $\alpha$ cl( $A$ ))  $\subset$   $cl(F(A))$ .

(vi) $\Rightarrow$ (vii) By lemma 2.4 (ii),  $F(\tau^*$ -gsint( $cl(A)$ ))  $\subset$   $cl(F(A))$  for any subset  $A$  of  $X$ .

(vii) $\Rightarrow$ (viii) This is obvious.

(viii) $\Rightarrow$ (i) Let  $x \in X$  and  $V$  be any open set such that  $F(x) \cap V \neq \emptyset$ . Then  $x \in F^-(V)$ . Now  $F^-(V) \in (\tau^*$ -g $\alpha$ ( $X$ )). By the hypothesis,  $F(cl(\text{int}(cl(F^+(Y-V)))) \subset cl(F(F^+(Y-V))) \subset Y-V$  and hence  $cl(\text{int}(cl(F^+(Y-V)))) \subset F^+(Y-V) = X - F^-(V)$ . Then we have  $F^-(V) \subset \text{int}(cl(\text{int}(F^-(V))))$  and hence  $F^-(V) \in \tau^*$ -g $\alpha$ ( $X$ ). put  $U = F^-(V)$ , we have  $x \in U \in \tau^*$ -g $\alpha$ ( $X$ ) and  $F(u) \cap V \neq \emptyset$  for every  $u \in U$ . Hence  $F$  is lower  $\tau^*$ -g $\alpha$  continuous.

**Note : 3.5 [12]**

A function  $f : X \rightarrow Y$  is  $\alpha$ -continuous if and only if it is pre continuous and semi-continuous.

**Definition: 3.6 [15]**

A subset  $A$  of a topological space  $X$  is said to be  $\alpha$ -paracompact if every cover of  $A$  by open sets of  $X$  is refined by a cover of  $A$  which consists of open sets of  $X$  and is locally finite in  $X$ .

**Definition: 3.7 [5]**

A subset  $A$  of topological space  $X$  is said to be  $\alpha$ -regular if for each point  $x \in A$  and each open set  $U$  of  $X$  containing  $x$ , there exists an open set  $G$  of  $X$  such that  $x \in G \subset cl(G) \subset U$ .

**Lemma: 3.8**

If  $A$  is an  $\alpha$ -regular  $\alpha$ -paracompact subset of a topological space  $X$  and  $U$  is an open neighbourhood of  $A$ , then there exists an open set  $G$  of  $X$  such that  $A \subset G \subset cl(G) \subset U$ . [5]

A multifunction  $F: X \rightarrow Y$  is said to be punctually  $\alpha$ -paracompact (resp. punctually  $\alpha$ -regular) if for each  $x \in X$ ,  $F(x)$  is  $\alpha$ -paracompact (resp.  $\alpha$ -regular). By  $\alpha cl(F): X \rightarrow Y$ , we shall denote a multifunction defined as follows:  $[\alpha cl(F)](x) = \alpha cl(F(x))$  for each point  $x \in X$ .

**Lemma: 3.9**

If  $F: (X, \tau^*) \rightarrow (Y, \sigma)$  is punctually  $\alpha$ -regular and punctually  $\alpha$ -paracompact, then  $[\tau^* - gacl(F)^+](V) = F^+(V)$  for every open set  $V$  of  $Y$ . [ $\tau^*$ -

**Proof:**

Let  $V$  be any open set of  $Y$  and  $x \in [\tau^* - gacl(F)^+](V)$ . Then  $\tau^* - gacl(F(x)) \subset V$  and hence  $F(x) \subset V$ . Then,  $x \in F^+(V)$  and hence  $[\tau^* - gacl(F)^+](V) \subset F^+(V)$ . Conversely, let  $V$  be any open set of  $Y$  and  $x \in F^+(V)$ . Then  $F(x) \subset V$ . Since  $F(x)$  is  $\alpha$ -regular and  $\alpha$ -paracompact, by lemma 3.8 there exists an open set  $G$  such that  $F(x) \subset G \subset cl(G) \subset V$ ; hence  $\tau^* - gacl(F(x)) \subset cl(G) \subset V$ . So that  $x \in [\tau^* - gacl(F)^+](V)$  and hence  $F^+(V) \subset [\tau^* - gacl(F)^+](V)$ . So, that  $[\tau^* - gacl(F)^+](V) = F^+(V)$ .

**Theorem: 3.10**

Let  $F: (X, \tau^*) \rightarrow (Y, \sigma)$  be punctually  $\alpha$ -regular and punctually  $\alpha$ -paracompact. Then  $F$  is upper  $\tau^*$ -ga continuous if and only if  $\tau^* - gacl(F): (X, \tau^*) \rightarrow (Y, \sigma)$  is upper  $\tau^*$ -ga continuous.

**Proof:**

Suppose that  $F$  is upper  $\tau^*$ -ga continuous. Let  $x \in X$  and  $V$  be any open set of  $Y$  such that  $\tau^* - gacl(F)(x) \subset V$ . By Lemma 3.9, we have  $x \in [\tau^* - gacl(F)^+](V) = F^+(V)$ . Since  $F$  is upper  $\tau^*$ -ga continuous, there exists  $U \in \tau^* - ga(X)$  containing  $x$  such that  $F(U) \subset V$ . Since  $F(u)$  is  $\alpha$ -paracompact and  $\alpha$ -regular for each  $u \in U$ , by Lemma 3.8, there exists an open set  $H$  such that  $F(u) \subset H \subset cl(H) \subset V$ . Then, we have  $\tau^* - gacl(F(u)) \subset cl(H) \subset V$  for each  $u \in U$  and hence  $\tau^* - gacl(F(U)) \subset V$ . Hence  $\tau^* - gacl(F)$  is upper  $\tau^*$ -ga continuous.

Conversely assume that  $\tau^* - gacl(F): (X, \tau^*) \rightarrow (Y, \sigma)$  is upper  $\tau^*$ -ga continuous. Let  $x \in X$  and  $V$  be any open set of  $Y$  such that  $F(x) \subset V$ . By Lemma 3.9, we have  $x \in F^+(V) = [\tau^* - gacl(F)^+](V)$  and hence  $[\tau^* - gacl(F)(x)] \subset V$ . Since  $\tau^* - gacl(F)$  is upper  $\tau^*$ -ga continuous, there exists  $U \in \tau^* - ga(X)$  containing  $x$  such that  $\tau^* - gacl(F(U)) \subset V$ ; hence  $F(U) \subset V$ . Then  $F$  is upper  $\tau^*$ -ga continuous.

**Theorem: 3.11**

A multifunction  $F: (X, \tau^*) \rightarrow (Y, \sigma)$  is lower  $\tau^*$ -ga continuous if and only if  $\tau^* - gacl(F): (X, \tau^*) \rightarrow (Y, \sigma)$  is lower  $\tau^*$ -ga continuous.

**Theorem: 3.12**

If  $F: (X, \tau^*) \rightarrow (Y, \sigma)$  is upper (resp. lower)  $\tau^*$ -ga continuous and  $F(X)$  is endowed with subspace topology, then  $F: X \rightarrow F(X)$  is upper (resp. lower)  $\tau^*$ -ga continuous.

**Proof:**

Since  $F: (X, \tau^*) \rightarrow (Y, \sigma)$  is upper (resp. lower)  $\tau^*$ -ga continuous for every open  $\tau^*$  subset  $V$  of  $Y$ ,  $F^+(V \cap F(X)) = F^+(V) \cap F^+(F(X)) = F^+(V)$  is  $\tau^*$ -ga open. Hence  $F: X \rightarrow F(X)$  is upper (resp. lower)  $\tau^*$ -ga continuous.

**Theorem: 3.13**

Let  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  and  $G : (Y, \sigma) \rightarrow (Z, \mu)$  be two multifunctions. Then  $G \circ F$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous, if  $G$  is semi continuous and  $F$  is  $\tau^*$ - $g\alpha$  continuous.

**Proof:**

Let  $V$  be an open set in  $Z$ . Since  $G$  is semi continuous then  $(G^+(V))$  is an open set in  $Y$  and since  $F$  is  $\tau^*$ - $g\alpha$  continuous then  $F^+(G^+(V)) = (G \circ F)^+(V)$  is an  $\tau^*$ - $g\alpha$  open set in  $X$ . Thus  $G \circ F$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous.

**Theorem: 3.14**

Let  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  be a multifunction and  $A$  be an open subset of  $X$ . If  $F$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous, then  $F|_A : A \rightarrow Y$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous multifunction.

**Proof:**

Let  $V$  be any open subset of  $Y$ . Since  $F$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous, then  $F^+(V)$  is  $\tau^*$ - $g\alpha$  open in  $X$ . Since  $A \cap F^+(V) = F^+|_A(V)$ , then  $F^+|_A(V)$  is  $\tau^*$ - $g\alpha$  open. Hence  $F|_A$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous multifunction.

**Theorem: 3.15**

Let  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  be a multifunction and  $\{U_\alpha : \alpha \in \Delta\}$  be an open cover of  $X$ . If the restriction function  $F|_{U_\alpha}$  is upper  $\tau^*$ - $g\alpha$  continuous for each  $\alpha \in \Delta$ , then  $F$  is upper  $\tau^*$ - $g\alpha$  continuous.

**Proof:**

Let  $V$  be any open subset of  $Y$ . Since  $F|_{U_\alpha}$  is upper  $\tau^*$ - $g\alpha$  continuous for each  $\alpha \in \Delta$ , then  $F^+|_{U_\alpha}(V) = U_\alpha \cap F^+(V)$  is  $\tau^*$ - $g\alpha$  open set.

Then  $\bigcup_{\alpha \in \Delta} (U_\alpha \cap F^+(V)) = \bigcup_{\alpha \in \Delta} (U_\alpha) \cap F^+(V) = X \cap F^+(V) = F^+(V)$  is  $\tau^*$ - $g\alpha$  open set. Hence,  $F$  is upper  $\tau^*$ - $g\alpha$  continuous.

**4. SOME PROPERTIES****Lemma:4.1 [15]**

Let  $A$  and  $B$  be subsets of a topological space  $X$ .

(i) If  $A \in sO(X) \cup pO(X)$  and  $B \in \alpha(X)$ , then  $A \cap B \in \alpha(A)$ .

(ii) If  $A \subset B \subset X$ ,  $A \in \alpha(B)$  and  $B \in \alpha(X)$ , then  $A \in \alpha(X)$ .

**Theorem: 4.2**

If a multifunction,  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous  $X_0 \in \tau^*$ - $gpO(X) \cup \tau^*$ - $gsO(X)$ , then the restriction  $F|_{X_0} : X_0 \rightarrow Y$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous.

**Proof:**

We prove that,  $F$  is upper  $\tau^*$ - $g\alpha$  continuous. Let  $x \in X_0$  and  $V$  be any open set of  $Y$  such that  $(F|_{X_0})(x) \subset V$ . Since  $F$  is upper  $\tau^*$ - $g\alpha$  continuous and  $(F|_{X_0})(x) = F(x)$  there exists  $U \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that  $F(U) \subset V$ . Set  $X_0 = F \cap X_0$ , then by lemma 4.1,  $x \in X_0 \in \tau^*$ - $g\alpha(X_0)$  and  $(F|_{X_0}) X_0 \subset V$ . Hence  $(F|_{X_0})$  is upper  $\tau^*$ - $g\alpha$  continuous.

**Theorem: 4.3**

A multifunction  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous if for each  $x \in X$  there exists  $X_0 \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that the restriction  $F|_{X_0} : X_0 \rightarrow Y$  is upper (resp. lower)  $\tau^*$ - $g\alpha$  continuous.

**Proof:**

We prove that,  $F$  is upper  $\tau^*$ - $g\alpha$  continuous. Let  $x \in X$  and  $V$  be any open set of  $Y$  such that  $F(x) \subset V$ . There exists  $X_0 \in \tau^*$ - $g\alpha(X)$  containing  $x$  such that  $F|_{X_0}$  is upper  $\tau^*$ - $g\alpha$  continuous.

Then there exists  $U_0 \in \tau^*$ - $g\alpha(X_0)$  containing  $x$  such that  $(F|_{X_0}) \subset X_0$ . By lemma 4.1  $U_0 \in \tau^*$ - $g\alpha(X)$  and  $F(u) = (F|_{X_0})(u)$  for every  $u \in U_0$ . Hence,  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  is upper  $\tau^*$ - $g\alpha$  continuous.

**Theorem: 4.4**

If  $F : (X, \tau^*) \rightarrow (Y, \sigma)$  is upper  $\tau^*$ - $g\alpha$  continuous multifunction into a Hausdorff space  $Y$  and  $F(x)$  is compact

for each  $x \in X$ , then the graph  $G(F)$  is  $\tau^*$ - $g\alpha$  closed in  $X \times Y$

**Proof:**

Let  $(x, y) \in X \times Y - G(F)$ . Then  $y \in Y - F(x)$ . For each  $a \in F(x)$ , there exist open sets  $V(a)$  and  $W(a)$  containing  $a$  and  $y$ , respectively, such that  $V(a) \cap W(a) = \emptyset$ . The family  $\{V(a) \mid a \in F(x)\}$  is an open cover of  $F(x)$  and there exist a finite number of points in  $F(x)$ , say,  $a_1, a_2, \dots, a_n$  such that  $F(x) \subset \bigcup_{1 \leq i \leq n} V(a_i)$ . Set  $V = \bigcup_{1 \leq i \leq n} V(a_i)$  and  $W = \bigcap_{1 \leq i \leq n} W(a_i)$ . Since  $F(x) \subset V$  and  $F$  is upper  $\tau^*$ - $g\alpha$  continuous, there exists  $U \in \tau^*$ - $g\alpha(X)$  such that  $x \in U$  and  $F(U) \subset V$ . So, we obtain  $F(U) \cap W = \emptyset$  and hence  $(U \times W) \cap G(F) = \emptyset$ . Since  $U \times W$  is  $\tau^*$ - $g\alpha$ -open  $X \times Y$  and  $(x, y) \in U \times W$ ,  $(x, y) \notin \tau^*$ - $g\alpha cl(G(F))$  and  $G(F)$  is  $\tau^*$ - $g\alpha$  closed in  $X \times Y$ .
