## Abstract:

Online Traveling blog is the system for promoting the travel business. The main point of developing this system is to help tourists to manage their wanderlust and help them to enjoy themselves there to the fullest. A blog is a type of website that is updated regularly in the form of posts. These posts can be stories and/or snippets of information, reviews, photographs, images, podcasts and other types of content that can be uploaded online. The project is developing because; in this pandemic times the travel industry has been hit hard. So by using our blog we can help potential travelers to look for their favorite destination . So, an online traveling blog will help the travelers to get a virtual experience before traveling.

## Keyword:

Website, Blog, Travel

## Introduction:

This is a blogging website. Here the user can post their content and read others content. Login is not necessary for reading the content. But, For creating new posts, login is necessary. Before publishing, every post is being verified by the admin. Admin verification is there to reduce anti-social activity. The admin also can Approve a blocked content and Block aa Approve content anytime. Admin can send personal messages to the content creator.

## Content Flow Diagram for User:

## Content Flow Diagram for Admin:

### Procedure:

One user can Enter into the website with login and also without login. He/She will be able to access all the approved content. The content will be sorted according to the time posted. If users want to search for a particular place, then they can search. The content will be remodified according to the search. They also can post their content on the website.

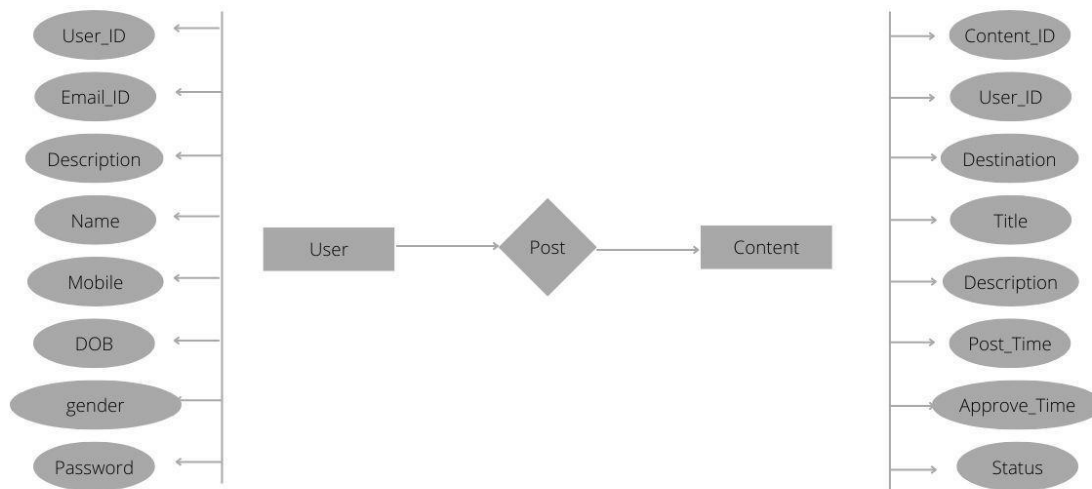

After a content is posted, it will wait in the admin Panel for approval. If it is approved by the Admin, then it will come to the news feed. And if it is blocked, then it will come to the Blocked Content List.

### Innovativeness:

In other social media platforms, unsocial contents can be posted. No restriction is there. As a result, all unsocial content became viral, before it's take down. So, here on our website, the Creator needs to wait for the permission of the Admin, before posting their content. We think this will be a great initiative to block unsocial content, and reduce negativity throughout social media.

If by mistake, the Admin approved an unsocial content, that content may be blocked later and vice versa is also possible. After a content gets blocked, again it can be approved.

## Database ER Diagram:

## Conclusion:

In this project we have built a web solution of social media content Sharing. We have built a DataBase schema design, ER Diagram and Finally coded that. Through this website, the content creator can upload their content and the User can watch those. And another main point of this website is, the user can see the content without their Account. Sometimes, some users don't want to create an account. This will be very much helpful for them.
