Abstract:
Heavy menstrual bleeding (HMB) is a common gynaecological complain with multiple aetiology and diverse pathological origins. Approximately 30% of women suffer from HMB during their reproductive age, but only one third of these women are confined to have underlying pathology of a type widely recognized to cause HMB. In conventional medicine, the treatment for menorrhagia include both hormonal (combined oral contraceptive pills, cyclic progestogens) or non-hormonal (Tranexamic acid) etc. Despite a fair success rate of these medicines, each has a substantial adverse effect. Traditional system of medicine including Greeko Arabic medicine are gaining popularity due to long history of use and several other benefits. Medicinal plants are being used since long time to treat various gynaecological disorders and emphasis is made on research to validate the efficacy and safety of these drugs in the present scenario. Several Habis (Hemostatic) and Qabid (Astringent) drugs are found effective in treating menorrhagia. Therefore, aim of this article is to review the etiopathogenesis, diagnosis, and management of HMB in Unani system of medicine and to summarize the research done on HMB using Unani medicine.

Key words: Heavy menstrual bleeding, Kaṭhrat-i-Tamṭh, Unani system of medicine.

Introduction:
Heavy menstrual bleeding (HMB) is the most common clinical presentation of AUB.1,2 It is defined as excessive menstrual blood loss which interferes with the women’s physical, emotional, social and maternal quality of life, and which can occur alone or in combination with other symptoms.3-4 In classical Unani text, Kaṭhrat-i-Tamṭh (HMB) is defined as excessive MBL either the bleeding is excessive in amount or duration. It is caused by Sāʾi-Mīzaj al-Rahim (which causes weakness of uterine vessels leading to its rupture), Qarha al-Rahim, Kharish al-Rahim, Bawasir al-Rahim. Moreover, dilatation of uterine vessels is caused by Riqqat-i-Khūn due to Ghalaba-i-Balḡham or Ḥiddat-i-Khūn due to Ghalabai-Ṣafra or Sawda’ resulting in Ḍuʿf Quwwat-i-Masika al-Rahim leading to increased MBL. Excessive
MBL leads to rapid pulse, giddiness, palpitation, increased thirst, generalised weakness and body ache etc. and if it is not treated may leads to complications such as Sū’al-Qinya (iron deficiency anaemia), Istesqa (ascites), _DYNAMIC_LINK (liver dysfunction) etc.5-11 The main goal of treatment in HMB is to improve QOL by controlling the bleeding,12 to prevent and treat anaemia and to restore an acceptable menstrual pattern.13

In conventional medicine, various medical treatment options are available but side effects often limit compliance and efficacy. Nonhormonal options are limited to tranexamic or mfenamic acid, while hormonal options include the levonorgestrel-releasing intrauterine system (LNG-IUS), the combined oral contraceptive pill or progestogen preparations.14-15 Surgical approaches like hysterectomy is sometimes essential for HMB treatment but many women desired to preserve uterus for their potential childbearing.15-16 Hence, need for alternate treatment option is required to control HMB in the form of medicinal plants, which plays a vital role in health care system. In recent years, globally there has been a tendency towards using complementary and alternative medicines in the treatment of diseases due to easy availability, affordability, cost effective and fewer side effect. Herbal medicine is a component of traditional medicine, which is becoming popular today and common people generally believed on herbal remedies. A wide variety of herbs are used to treat HMB and many studies have demonstrated the beneficial effects of medicinal plants on HMB.17

Methods: Classical Unani text was extensively searched to compile the Unani concept of Kaṭhrat-i-Tamṯ. Then, a search was made on major scientific search engines such as Scopus, PubMed, Google Scholar and Science Direct with key words: Heavy menstrual bleeding, Kaṭhrat-i-Tamṯ, Unani drugs having astringent, haemostatic, antifibrinolytic, anti-inflammatory activities and scientific evidence of efficacy and safety of these Unani drugs in HMB.

Unani concept:

Definition: Increase menstrual blood loss either in amount or duration is known as Kaṭhrat-i-Tamṯ.5,7

Etiology: Kaṭhrat-i-Tamṯ occur mainly due to weakness of retentive power (Quwwat-i-Masika) of uterus secondary to altered temperament of uterus (Sū’i-Mizaj al-Rahim) or strong expulsive power (Quwwat-i-Daf’ya) of uterus secondary to Khilt-i-Laḏha or Kaṭhrat-i-Khūn or both.5,6,8,9,17-19 Its causes are classified into two categories.
Causes pertaining to uterus: Ḍu’f al-Raḥim (uterine weakness) as in multiparity, abortion, and excessive intercourse, Qarḥ al-Raḥim (uterine ulcer), Bawasir al-Raḥim (uterine polyp), Kharish al-Raḥim, Shiqaq al-Raḥim (uterine rupture), Rupture or dilatation of uterine vessels secondary to Sū’i-Mizaj al-Raḥim, Ḍarbā wa saqta Rahim (trauma & injury to uterus) resulting in rupture of uterine vessels.

Causes pertaining to blood: Imtela-i-Khūn or Kaṭhrat-i-Khūn (either increased production of blood or decreased consumption of blood by the body), thus Tab’iyat eliminates excess amount of blood in the form of menstruation. Moreover, congestion of blood in uterine vessels stimulates the expulsive power of uterus which in turn causes Kaṭhrat-i-Tamṭh, resulting in Tanqiya Badan (detoxification of body). Blood is normal in quality or quantity but ḏuf Badan causes Kaṭhrat-i-Tamṭh. Even qualitative or quantitative changes in blood like Riqqat-i-Khūn (increased fluidity of blood) due to Kaṭhrat-i-Ruṭubat Ma’ye or Latafat-i-Khūn causes weakness of uterine vessels leading to HMB. Narrow path of vessels causes flow of thin and scanty blood and wider path of vessels causes flow of thick and profuse blood.

Clinical presentation: During menstruation, initially thin & scanty blood flow occur followed by thick & heavy blood flow, if this continues for longer duration again thin and scanty blood flow occur. Associated symptoms are anorexia, indigestion, increased thirst, palpitation, generalized body ache, excessive tiredness, giddiness etc. clinical examination findings are pallor, rapid pulse, cold and clammy skin, high coloured urine, generalized edema.

Diagnosis: HMB can be diagnosed with history and clinical examination.

- Qarḥ al-Raḥim: Thick and heavy bleeding during menstruation mixed with pus and associated with pain.
- Bawasir al-Raḥim: Scanty and dark coloured bleeding during menstruation or inter menstrual bleeding with pain and heaviness in head, pain in hypochondriac region.
- Ḍu’f al-Raḥim: Fresh and painless bleeding associated with headache, nausea, increased thirst, pallor and rapid pulse.
- Imtela or Kaṭhrat-i-Khūn: Evident by signs of congestion like flushing of face, heaviness in the body, painful & continuous bleeding; women feel relief & energetic following the menstruation.
- **Hiddat-i-Khūn (Ghalba-i-Ṣafra):** Manifested in the form of burning sensation in the body, fever, weakness, excessive thirst, bitter taste in mouth, pallor, yellowish red and thin menstrual blood which flows frequently.⁵-⁷

- **Riqqat-i-Khūn (Ghalba-i-Balğham):** Exhibited as thin and pale menstrual blood associated with generalized weakness, palpitation, decreased thirst, increased salivation, puffiness of face, pallor and severe pain.⁵,⁷,¹⁰

- **Ḍu’f-i-Badan:** Manifested by malaise or fatigue, excessive tiredness and anaemia.

Differential diagnosis: *Kaṭhrat-i-Tamṭh*, is differentiated from *Istehaḍa* (DUB) in which bleeding is irregular, excessive in amount and for prolonged duration.

Principles of treatment: The treatment plan of *Kaṭhrat-i-Tamṭh*, in Unani system of medicine is mainly based on concept that, treat the actual cause of HMB (*Iţal-i-Sabab*), *Tanqiya-i-Badan* (detoxification of body) with *T’deel Miţaj* (change of temperament) in *Ṣā’i-Miţaj Sada* and *Istifţaṛgh mada* (elimination of morbid matter) in *Ṣā’i-Miţaj Maddi*, use of Ḥabīs (haemostatic) and Qabiḍ (astringent) drugs to control bleeding and finally use of *Muqawwī al-Raḩīm Advia* (uterotonics) to strengthen the uterus.⁶

B- Compound formulations for oral use:

- **Qurs koharba:** It is very beneficial to arrest excessive MBL (Nuskha: Kishneez Khusk Biryan, Tukhm Khashkash Siyah, wa Safaid each 60g, Koharba, Busd, Marwareed, Tukhm Khurfa Muqashshar each 50g, Shakh-i-Gozan Sokhta, Post Baiq-i-Murgh Sokhta, Kateera, Samaqh-i-Arabi each 30g, Banj Bazrul Safaid 20g and make Qurs in Luab Isapgol.21,22

- **Safūf Ḥabis-al-Dam:** Dam-al-Akhwain, Samaqh-i-Arabi, Gul-i-Surkh, Sang-i-Jarahat, Sadaf all in equal quantity; finely powdered and used in a dose of 3g twice daily to prevent menstrual bleeding.21

- **Sharbat-i-Anjbar:** Post Beekh-i-Anjbar 35g, Kharnūb Shami 25g, Burada Šandal Safaid wa Surkh each 10g, Ḥabdul Aas 10g, Aab Aahan Tab, Qand Safaid 500g and use 25-50 ml to prevent menstrual bleeding.22,23

- **Majun busud:** (Nuskha: Busd, Koharba, Shibb-i-Yamani, Shadanq Maqsūl, Dam-al-Akhwain, Gil-i-Armani, Gil-i-Makhtūm, Gulnar Farsi all in equal quantity and prepare majun and used 7-17.5g with Aab Simaaq or Bartang or Khurfa).7

- **Decoction:** Juft Baloot and Tukhm Munaqqa with Sharab Qabiḍ or Kundur or Aqāquia with Sirka.20

- **Powder:**
  - Gil-i-Makhtūm, Gil-i-Armani, Shibb-i-Yamani, Dam-al-Akhwain, Kafür, each 7g and used with Sharbat-i-Morid.7
  - Sang-i-Jarahat, Maq Sabz, Kath Safaid, Maeen.
  - Khar Mohra Sokhta, Shakh Gozan Sokhta, Khabsul Ḥadeed each 18g, Gulnar 36g, Kishneez, Zeera each 10.5g, Gile Qabrasi 14 g, Juft Balūt, Simaaq, Zarishk, Tukhm Khurfa each 7g finely powdered and used in a dose of 4 ½g with Aab Aahan tab.6
  - Khabsul Hadeed and Fishar-i-Kundur, finely powdered and soak in Sharab Khalis for 3 days and used before and after meals.24
  - BazrulBanj1-2g with sugar daily for 3 days.

- **Tablets:**
  - Aqāquia, Gulnar, Maqū, Simaaq, Kundur and used in a dose of 1¾g.6
• Afyūn, Chhal Kundur, Gil-i-Armani, Koharba, Aqaqia and use with Aab Angūr Kham.\textsuperscript{7}

• **Infusion:** Use lu’ab of Gond Babūl, Dhaniya Khushk and Tukhm Alsi after soaking in hot water.\textsuperscript{7}

• **Water:** Aab Berg Khurfa or Aab Bartang with Gulnar and Gil-i-Armani.\textsuperscript{7}

</tr>
</tbody>
</table>

**Ilaj bil tadbeer (Regimenal Therapy):**

- Patient is instructed to sleep in supine position with foot end elevation to prevent blood flow towards the uterus and cold fomentation with ice or alum mixed in cold water is recommended over the suprapubic region.\textsuperscript{22}

- If medical treatment fails to control the HMB, then application of tight bandage below the breast for **Imal-i-Madda** (diversion of humours) and to prevent blood flow towards the uterus.\textsuperscript{7}

- Apply tight bandage to both hands & legs to prevent the menstrual blood loss, if it fails to control then apply hijama (cupping) to the breast.
• Application of *hijamat bila shrut* (dry cupping) below the breast to arrest menstrual blood loss; too large size cups are applied on inferior surface of breast as veins from uterus to breast reaches at this level. Moreover, large cups forcefully draw the blood away from the uterus.\(^6,8,17\)

• Excessive exercise,\(^9\) application of tight bandage on both the hands as well as on both the breast and dry cupping in between the buttocks to reduce pelvic congestion are recommended if HMB is due to *Intela-i-Khūn*.\(^6,8,9,17,20\)

**Ilaj bil yad (Surgical Treatment):**

• Venesection of *Rag-i-Basaleeq* (basilic vein) to divert the menstrual blood flow upwards and to prevent the menstrual bleeding,

• Venesection of *Rag-i-Qeefaal* (cephalic vein). \(^7,11\)

• Venesection of *Rag-i-Basaleeq* (basalic vein) or *Rag-i-Akhal* (median vein) to reduce pelvic congestion is recommended if HMB is due to *Intela-i-Khūn*.\(^7,10,11,20\)

</tbody>
</table>
|   | **Quince (Behi dana)**  
*Cydonia oblonga*  
Pilot study (n= 35) | A tea spoonful of "Quince paste" was given for 2 months.  
PBAC score decreased significantly from 264.2 ± 198.9 to 125.8±155.9 (p<0.001). QoL score decreased significantly from 30.28 ± 5.73 to 22.02 ± 3 (p<0.001).  
28  
|   | **Tukhm Khurfa**  
(Portulaca oleracea Linn.)  
Pilot study (n=30) | *Tukhm khurfa* 2 g capsules TDS was given from D1-D10 of cycle for 2 consecutive cycles.  
Significant reduction in PBAC score, & improvement in SF-12 score (p< 0.001)  
29  
|   | **Lentil (Masoor)**  
(Lens culinaris)  
Standard controlled RCT (n= 36) | lentil savigh 30 g from D1-D7 of menstruation  
It significantly reduced the AOF & improved the QoL as compared to tranexamic acid  
Lentils have high antioxidant activity, high content of phytosterogen, & nutrients like flavonoids, tannin, & phytic acid. Lentils contain significant amounts of tannin & vitamin K, both of which play an important role in controlling the menstrual bleeding. Tannin has styptic & astringent properties and can cause endothelium capillary contractions, thus prevents MBL. | Shafiee M. *et al* (2019)  
30  
|   | **Chamomile (Babuna)**  
Randomized, clinical trial, (n=118) | Chamomile capsule 250 mg TDS starting from 7 days prior to menses till the onset of next period for one cycle.  
The average amount of menstrual bleeding decreased in chamomile group after taking the capsule (p = 0.001).  
Anti-inflammatory, sedative, antispasmodic due to the presence of flavones, glycosides & other constituents of volatile oil. | Mollabashi EN. *et al* (2020)  
31  

| **Proved Polyherbal formulations in HMB:**

**Singh MR. et al**  
32 conducted the study on 55 cases of puberty menorrhagia who were divided in test (n=30) and control (n=25) groups and in test group *Safīf Habis* (*Dam-al-Akhwain, Samağh-i-Arabi, Sang-i-Jarahat, Guli-Surkh*) 3 g twice daily was administered orally from first day of cycle till bleeding stops for 3 cycles and in control group, tab styptocid (standard drug) one tablet twice daily was given for the same duration. Mean reduction in PBAC score was significant in test than compared to control group with p<0.001.

**Geetha BN. et al**  
33 conducted the study on 40 diagnosed cases of DUB, who were randomly allocated to test (n=20) and control (n=20) groups. In test group, Unani formulations (*Safīf Habis* and *Majoon Muqawwi Rahim Sada*), each in a dose of 6 gm twice daily during an active bleeding phase and interval respectively; while in control group, standard drug (norethisterone acetate-5mg) three times daily during an active bleeding phase followed by
5mg once daily for 21 days. The above interventions were administered orally for three consecutive cycles. Menstrual regulation was achieved in 58.8% patients in test and 63.2% in control groups (P= 1.000); improvement in PBAC score was observed in 100% patients in both the groups (P = 1.000). Hence, these Unani formulations can be used as an effective alternative in patients with DUB.

Shahmeer KSK. et al 34 demonstrated the study on 30 diagnosed patients of HMB and Unani formulation comprises of Khurma (Phoenix dactylifera Linn), Rasaut (Berberis aristata), Talmakhana (Asteracantha longifolia Linn), Lodh pathani (Symplocos racemosa Roxb) was administered orally in powder form in a dose of 3g with 2g sugar, twice daily for seven days/cycle for three consecutive cycles. The authors reported clinical response of 30-50% in MBL and DOB in 86.7% and 56.7% patients respectively with p< 0.001** and improvement in Hb% and QOL in 16.7% (p=0.228) and 100% (p< 0.001**) patients respectively. Hence, this formulation can be used as an alternate option in patients with HMB as it has a significant effect in controlling the bleeding by reduction in MBL and DOB.

Discussion: HMB is one of the most frequently encountered symptoms in gynaecology, which leads to a significant interference with women’s physical, emotional, social and material quality of life, and a considerable economic burden on the healthcare system. Excessive regular blood loss of this magnitude leads to significant adverse impact on woman’s iron metabolism causing iron deficiency anaemia. Most of the medicinal herbs contains tannins and are effective to control the bleeding. Tannins have an astringent action and can contract capillary endothelium, thus results in decreased exudation and menstrual blood loss. Several medicinal plants mentioned under the management of HMB in USM are rich in tannins, for example, Quince, Acacia, Coriander, Jasmine, Cypress, Dracaena, Millet, Sandal Wood, Rose, Lentil, Cedar, Myrtle, Sumac etc. Hence, these Unani drugs can be used in day to day clinical practice due to their beneficial effects since ancient times as mentioned in the literature. Further, randomized controlled trials on large sample size are recommended to proof the efficacy and safety of these Unani drugs in the management of HMB.
